How are Arduino sketches executed on the nRF52832? Can I do hard real time processing (bit-banging NeoPixels, etc.)?	153
Can I use GDB to debug my nR52832?	153
Are there any other cross platform or free debugging options other than GDB?	154

Introduction

The **Adafruit Feather nRF52 Bluefruit** is our latest easy-to-use all-in-one Bluetooth Low Energy board, with a native-bluetooth chip, the nRF52832! It's our take on an 'all-in-one' Arduino-compatible + Bluetooth Low Energy with built in USB and battery charging.

This chip has twice the flash, SRAM and performance of the earlier nRF51-based Bluefruit modules. Best of all it has Arduino IDE support so there is no 'helper' chip like the ATmega32u4 or ATSAM21. Instead, this chip is programmed directly! It's got tons of awesome peripherals: plenty of GPIO, analog inputs, PWM, timers, etc. Leaving out the extra microcontroller means the price, complexity and power-usage are all lower/better. It allows you to run code directly on the nRF52832, straight from the Arduino IDE as you would with any other MCU or Arduino compatible device. A single MCU means better performance, lower overall power consumption, and lower production costs if you ever want to design your own hardware based on your Bluefruit nRF52 Feather project!

The chips are pre-programmed with an auto-resetting bootloader so you can upload quickly in the Arduino IDE with no button-pressing. Want to program the chip directly? You can use our command line tools with your favorite editor and toolchain.

And to get you up and running quickly, we've done all the heavy lifting of getting the low level BLE stack into shape so that you can focus on your project from day one!

nRF52832 Technical Details

- ARM Cortex M4F (with HW floating point acceleration) running at 64MHz
- 512KB flash and 64KB SRAM
- **Built in USB Serial converter for fast and efficient programming and debugging**
- Bluetooth Low Energy compatible 2.4GHz radio (Details available in the [nRF52832](#) product specification)
- **FCC / IC / TELEC certified module**
- Up to +4dBm output power
- 1.7v to 3.3v operation with internal linear and DC/DC voltage regulators
- 19 GPIO, 8 x 12-bit ADC pins, up to 12 PWM outputs (3 PWM modules with 4 outputs each)
- Pin #17 red LED for general purpose blinking
- Power/enable pin
- Measures 2.0" x 0.9" x 0.28" (51mm x 23mm x 8mm) without headers soldered in
- Light as a (large?) feather - 5.7 grams
- 4 mounting holes
- Reset button
- Optional SWD connector for debugging
- **Works out of the box with just about all of our Adafruit FeatherWings!** (Wings that require the UART like the GPS FeatherWing won't work)

Further technical details available in the [nRF52832](#) product specification.

Like all of our Feather boards, the Bluefruit nRF52 Feather includes on board USB-based LIPO charging, and has a standard LIPO battery connector to make your wireless projects genuinely 'wireless' at no additional cost (aside from the LIPO cell itself).

nRF51 or nRF52 Bluefruit Devices?

The Bluefruit nRF52 Feather (based on the [nRF52832](#) SoC) is quite different from the earlier nRF51822 based Bluefruit products ([Bluefruit M0 Feather](#), etc.), both of which will continue to exist.

From a hardware perspective, the nRF52 Feather is based on a much more powerful ARM Cortex M4F processor, with 512KB flash, 64KB SRAM and hardware floating point acceleration ... whereas the earlier nRF51822 is based on the smaller ARM Cortex M0 core (fewer internal instructions), with 256KB flash and either 16KB or 32KB SRAM.

More importantly, the design approach that we took with the nRF52 is completely different:

- nRF51 based Bluefruit boards run as modules that you connect to via an external MCU (typically an Atmel 32u4 or a SAMD21), sending AT style commands over SPI or UART.
- **With the nRF52, you run all of your code directly on the nRF52832 and no external MCU is used or required!**

This change of design helps keep the overall costs lower, allows for far better performance since you aren't limited by the SPI or UART transport channel, and can help improve overall power consumption.

As a tradeoff, it also means a completely different API and development process, though!

nRF51 Bluefruit sketches won't run on nRF52 Bluefruit hardware without modification! The two device families have different APIs and programming models, and aim to solve your wireless problems in two different ways.

Device Pinout

BLUEFRUIT NRF52 FEATHER PINOUT

Special Notes

The following pins have some restrictions that need to be taken into account when using them:

- **PIN_DFU / P0.20:** If this pin is detected to be at GND level at startup, the board will enter a special serial bootloader mode and will not execute any user code, going straight into bootloader mode. If you wish to use this pin as a standard GPIO, make sure that it is pulled high with a pullup resistor so that your code will execute normally when the MCU starts up.
- **P0.31 / A7:** This pin is hard wired to a voltage-divider on the LIPO battery input, allow you to safely measure the LIPO battery level on your device. If possible, **you should avoid using this pin directly.**
- **FRST/P0.22:** Setting this pin to GND at startup will cause the device to perform a factory reset at startup, erasing and config data as well as the user sketch. At the next reset, you should enter serial bootloader mode by default, since no user sketch will be present. You can use this to recover 'bricked' boards, but if you don't wish to do this be careful not to have FRST low at startup. By default, a weak internal pull-up resistor is enabled on this pin during the bootloader phase.

Power Pins

- **3.3V Output:** This two pins are connected to the output of the on board 3.3V regulator. They can be used to

supply 3.3V power to external sensors, breakouts or Feather Wings.

- **LIPO Input (VBAT):** This is the voltage supply off the optional LIPO cell that can be connected via the JST PH connector. It is nominally ~3.5-4.2V.
- **VREG Enable:** This pin can be set to GND to disable the 3.3V output from the on board voltage regulator. By default it is set high via a pullup resistor.
- **USB Power (VBUS):** This is the voltage supply off USB connector, nominally 4.5-5.2V.

Analog Inputs

The 8 available analog inputs can be configured to generate 8, 10 or 12-bit data (or 14-bits with over-sampling), at speeds up to 200kHz (depending on the bit-width of the values generated), based on either an internal 0.6V reference or the external supply.

The following default values are used:

- **Default voltage range:** 0-3.6V (uses the internal 0.6V reference with 1/6 gain)
- **Default resolution:** 10-bit (0..4095)

Unlike digital functions, which can be remapped to any GPIO/digital pin, the ADC functionality is tied to specified pins, labelled as A* in the image above (A0, A1, etc.).

PWM Outputs

Any GPIO pin can be configured as a PWM output, using the dedicated PWM block.

Three PWM modules can provide up to 12 PWM channels with individual frequency control in groups of up to four channels.

Please note that DMA based PWM output is still a work in progress in the initial release of the nRF52 BSP, and further improvements are planned here.

I2C Pins

I2C pins on the nRF52832 require external pullup resistors to function, which are not present on the Adafruit nRF52 Feather by default. You will need to supply external pullups to use these. All Adafruit I2C breakouts have appropriate pullups on them already, so this normally won't be an issue for you.

Assembly

We ship Feathers fully tested but without headers attached - this gives you the most flexibility on choosing how to use and configure your Feather

Header Options!

Before you go gung-ho on soldering, there's a few options to consider!

The first option is soldering in plain male headers, this lets you plug in the Feather into a solderless breadboard

Another option is to go with socket female headers. This won't let you plug the Feather into a breadboard but it will let you attach featherwings very easily

We also have 'slim' versions of the female headers, that are a little shorter and give a more compact shape

Finally, there's the "Stacking Header" option. This one is sort of the best-of-both-worlds. You get the ability to plug into a solderless breadboard *and* plug a featherwing on top. But its a little bulky

Soldering in Plain Headers

Prepare the header strip:

Cut the strip to length if necessary. It will be easier to solder if you insert it into a breadboard - **long pins down**

Add the breakout board:

Place the breakout board over the pins so that the short pins poke through the breakout pads

And Solder!

Be sure to solder all pins for reliable electrical contact.

(For tips on soldering, be sure to check out our [Guide to Excellent Soldering](https://adafruit.it/aTk) (<https://adafruit.it/aTk>)).

Solder the other strip as well.

You're done! Check your solder joints visually and continue onto the next steps

Soldering on Female Header

Tape In Place

For sockets you'll want to tape them in place so when you flip over the board they don't fall out

Flip & Tack Solder

After flipping over, solder one or two points on each strip, to 'tack' the header in place

And Solder!

Be sure to solder all pins for reliable electrical contact.

(For tips on soldering, be sure to check out our [Guide to Excellent Soldering](https://adafruit.it/aTk) (<https://adafruit.it/aTk>)).

You're done! Check your solder joints visually and continue onto the next steps

Arduino BSP Setup

You can install the Adafruit Bluefruit nRF52 BSP in two steps:

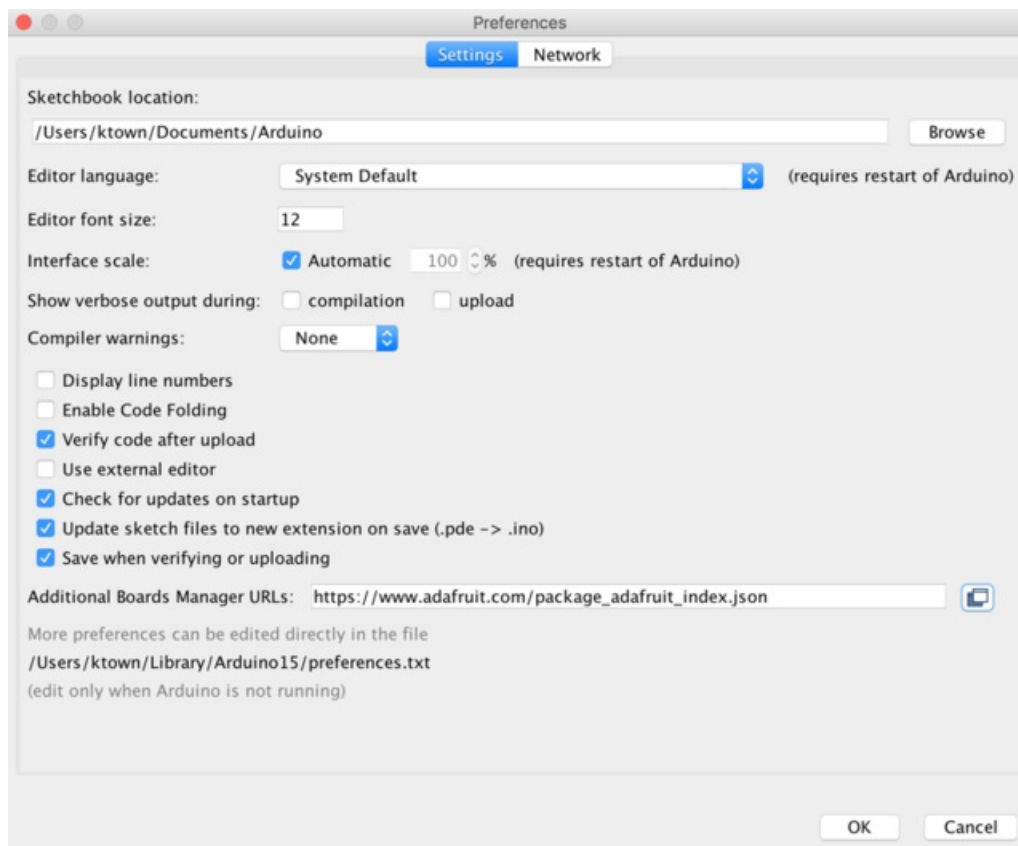

nRF52 support requires at least Arduino IDE version 1.6.12! Please make sure you have an up to date version before proceeding with this guide!

Please consult the FAQ section at the bottom of this page if you run into any problems installing or using this BSP!

1. BSP Installation

Recommended: Installing the BSP via the Board Manager

- [Download and install the Arduino IDE](#) (At least v1.6.12)
- Start the Arduino IDE
- Go into Preferences
- Add https://www.adafruit.com/package_adafruit_index.json as an 'Additional Board Manager URL' (see image below)

- Restart the Arduino IDE
- Open the **Boards Manager** option from the **Tools -> Board** menu and install '**Adafruit nRF52 by Adafruit**' (see image below)

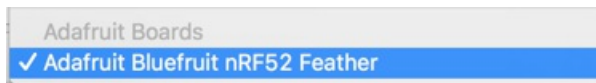

It will take up to a few minutes to finish installing the cross-compiling toolchain and tools associated with this BSP.

The delay during the installation stage shown in the image below is normal, please be patient and let the installation terminate normally:

- Once the BSP is installed, select '**Adafruit Bluefruit nRF52 Feather**' from the **Tools -> Board** menu, which will update your system config to use the right compiler and settings for the nRF52:

2. Third Party Tool Installation

The following third party tools must also be installed on your system to allow you to work with the Bluefruit nRF52 Feather:

This step is only required on OS X and Linux. If you are using Windows, a pre-built 32-bit binary of nrfutil is already included in the BSP that should work out of the box for most setups.

You will need to have both Python and pip available on your system to use the tools below!

nrfutil (OS X and Linux Only)

This is a [python wrapper](#) for Nordic's **nrfutil**, which is used to flash boards using the built in serial bootloader.

To install this tool, open a terminal or command prompt window and go into the folder where the BSP was installed in step one above.

Depending on your operating system. The BSP should be located in one of the following paths:

- **Windows:** %APPDATA%\Local\Arduino15\packages\adafruit\hardware\nrf52
- **OS X:** ~/Library/Arduino15/packages/adafruit/hardware/nrf52
- **Linux:** ~/.arduino15/packages/adafruit/hardware/nrf52

The path above will also include a sub-folder with the version number (ex. `0.6.0`). Be sure to enter that sub-folder as well, for example:

```
$ cd ~/Library/Arduino15/packages/adafruit/hardware/nrf52
$ ls
0.6.0/
$ cd 0.6.0
```

Next go into the `tools/nrfutil-0.5.2` folder in the path above, and run the following commands to make nrfutil available to the Arduino IDE:

```
$ cd tools/nrfutil-0.5.2
$ sudo pip install -r requirements.txt
$ sudo python setup.py install
```

Don't install nrfutil from the pip package (ex. `sudo pip install nrfutil`). The latest nrfutil does not support DFU via Serial, and you should install the local copy of 0.5.2 included with the BSP via the `python setup.py install` command above.

If you get a 'sudo: pip: command not found' error running 'sudo pip install', you can install pip via 'sudo easy_install pip'

3. Advanced Option: Manually Install the BSP via 'git'

If you wish to do any development against the core codebase (generate pull requests, etc.), you can also optionally install the Adafruit nRF52 BSP manually using 'git', as described below:

Adafruit nRF52 BSP via git (for core development and PRs only)

1. Install BSP via Board Manager as above to install compiler & tools.
2. Delete the core folder `nrf52` installed by Board Manager in Arduino15, depending on your OS. It could be
OS X: `~/Library/Arduino15/packages/adafruit/hardware/nrf52`
Linux: `~/Library/Arduino15/packages/adafruit/hardware/nrf52`
Windows: `%APPDATA%\Local\Arduino15\packages\adafruit\hardware\nrf52`
3. Go to the sketchbook folder on your command line, which should be one of the following:
OS X: `~/Documents/Arduino`
Linux: `~/Arduino`
Windows: `~/Documents/Arduino`
4. Create a folder named `hardware/Adafruit`, if it does not exist, and change directories into it.
5. Clone the `Adafruit_nRF52_Arduino` repo in the folder described in step 2:
`git clone git@github.com:adafruit/Adafruit_nRF52_Arduino.git`
6. This should result in a final folder name like `~/Documents/Arduino/hardware/Adafruit/Adafruit_nRF52_Arduino` (OS X).
7. Restart the Arduino IDE

BSP FAQs

The following FAQs may be useful if you run into any problems:

Windows Related

If you are using BSP 0.6.0 or greater, there are no known issues with the BSP installation process on Windows. Please update to the latest version if you currently have an earlier release.

OS X Related

I can compile and link sketches on OS X, but nrfutil gives me the following error: 'AttributeError: 'int' object has no attribute 'value''

Depending on your system setup and Python version, you may need to make a manual adjustment to a file in nrfutil, which is used when compiling and flashing files from the Arduino IDE.

Open the following file (please note that the BSP version number in the path may be different!):

`~/Library/Arduino15/packages/adafruit/hardware/nrf52/0.5.1/tools/nrfutil-0.5.2/nordicsemi/dfu/init_packet.py` ... and make the following changes:

```
@@ -79,7 +79,7 @@
-     for key in sorted(self.init_packet_fields.keys(), key=lambda x: x.value):
+     for key in sorted(self.init_packet_fields.keys(), key=lambda x: x):

```

Linux Related

On Linux I'm getting 'arm-none-eabi-g++: no such file or directory', even though 'arm-none-eabi-g++' exists in the path specified. What should I do?

This is probably caused by a conflict between 32-bit and 64-bit versions of the compiler, libc and the IDE. The compiler uses 32-bit binaries, so you also need to have a 32-bit version of libc installed on your system ([details](#)). Try running the following commands from the command line to resolve this:

```
sudo dpkg --add-architecture i386
sudo apt-get update
sudo apt-get install libc6:i386
```

Arduino Board Setup

Once you have the Bluefruit nRF52 BSP setup on your system, you need to select the appropriate board, which will determine the compiler and expose some new menu options:

1. Select the Board Target

- Go to the **Tools** menu
- Select **Tools > Board > Adafruit Bluefruit nRF52 Feather**

2. Select the USB CDC Serial Port

Finally, you need to set the serial port used by Serial Monitor and the serial bootloader:

- Go to **Tools > Port** and select the appropriate SiLabs device

Non OS X Operating Systems

If you don't see the SiLabs device listed, you may need to install the [SiLabs CP2104 driver](#) on your system.

OS X Only

Depending on the version of OS X you are running, you may need to select a different driver. See the link below for details:

Click here to download the CP2104 USB Driver
for OS X

<https://adafru.it/yna>

If you are using Mac OS 10.12.6 (Sierra) and you cannot upload with the latest Mac OS VCP driver, please try the legacy v4 driver below. Note you will need to uninstall the v5 driver using `uninstall.sh` (in the driver package)

Download the CP2104 Legacy USB Driver

<https://adafru.it/ymF>

3. Run a Test Sketch

At this point, you should be able to run a test sketch from the **Examples** folder, or just flash the following blinky code from the Arduino IDE:

```
void setup() {  
  pinMode(LED_BUILTIN, OUTPUT);  
}  
  
void loop() {  
  digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)  
  delay(1000);                     // wait for a second  
  digitalWrite(LED_BUILTIN, LOW);  // turn the LED off by making the voltage LOW  
  delay(1000);                     // wait for a second  
}
```

This will blink the pin #17 red LED on the Feather

Using the Bootloader

This page is for information purposes only. Normally the bootloader will work transparently and automatically from the Arduino IDE, requiring no manual intervention on your behalf.

The Bluefruit nRF52 Feather includes a customized version of the Nordic bootloader that enables serial support, over the air (OTA) DFU support, and various fail safe features like factory reset when the FRST pin is grounded at startup.

The bootloader that all Bluefruit nRF52 Feathers ships with allows you to flash user sketches to the nRF52832 using only the CP2104 USB to serial adapter populated on the board.

Forcing Serial Boot Mode

The Bluefruit nRF52 Feather is designed to briefly enter serial bootloader mode for a short delay every time the device comes out of reset, and the DTR line on the CP2104 USB to Serial adapter will trigger a reset every time the Serial Monitor is opened. This means that you can normally flash a user sketch to the nRF52 with no manual intervention on your part at a HW level.

If you need to force the serial bootloader mode, however, you can connect the **DFU** pin to **GND** at startup, which will force you to enter serial bootloader mode and stay in that mode until you reset or power cycle the board.

This can be used to recover bricked boards where a bad user sketch has been uploaded, since you will enter serial bootloader mode without executing the user sketch, and you can flash a new sketch directly from the Arduino IDE.

Forcing the serial bootloader can often be used to recover bricked devices.

Factory Reset

The Bluefruit nRF52 Feather has an optional FRST pad on the bottom of the PCB.

If you brick your device, you can solder a wire to the **FRST** pad, connecting it to **GND**. When a GND state is detected at power up the following actions will be performed:

- The user application flash section will be erased
- The user 'App Data' section that stores non volatile config data will be erased

This will cause the device to enter serial bootloader mode at startup, and the user sketch or config data that caused the device to stop responding should be removed.

Be sure to disconnect the pin from GND after a successful factory reset!

Advanced: OTA DFU Bootloader

While this is only recommended for advanced users, you can also force OTA (Over The Air) DFU bootloader mode to enable OTA updates using BLE and Nordic's proprietary update protocol (which is supported by both Nordic mobile apps, and our own Bluefruit LE Connect).

To force OTA DFU mode, set both FRST and DFU to GND at startup. Power cycling the board will cause the device to boot up into OTA DFU mode.

This option is not actively supported nor recommended by Adafruit, and we are still working on making this as safe as possible for users via our Bluefruit LE Connect application. Use OTA DFU at your own risk knowing you can brick your device and may need a Segger J-Link or similar device to regain control of it!

Advanced: Upgrading an Existing Bootloader

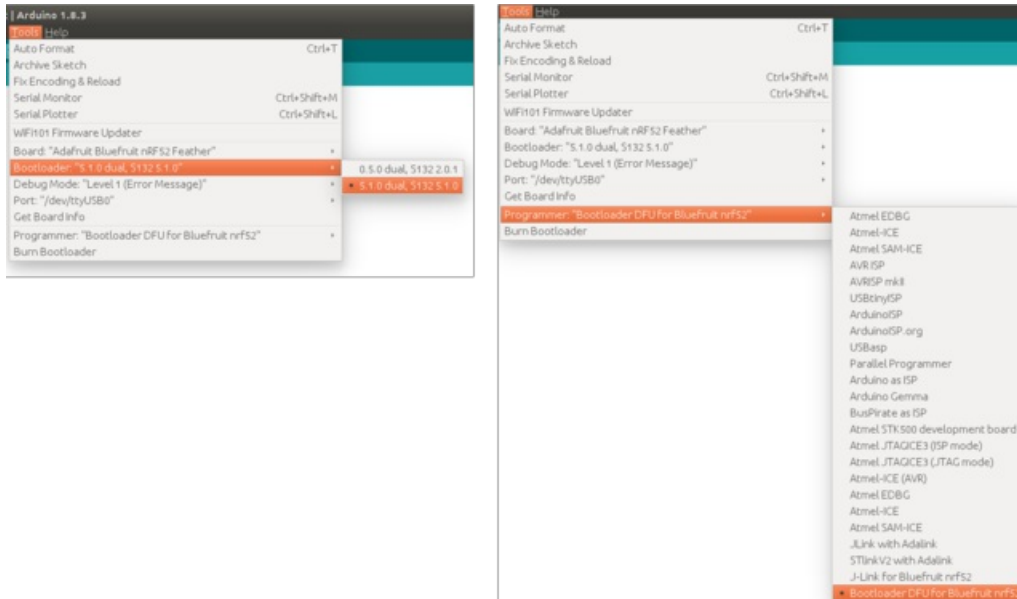

The Adafruit Feather nRF52 Bootloader binary contains not only the DFU code, but also the Bluetooth stack (a.k.a SoftDevice) to make sure they work together reliably. To get the latest and greatest features from the stack such as Bluetooth 5.0 with higher throughput, increased broadcast capacities or larger MTU it is necessary to upgrade the Bootloader to get the latest stack.

Luckily the Bluefruit nRF52 Bootloader can be upgraded/downgraded without any additional hardware, and we can even do that right in the Arduino IDE without at risk of typos or common user errors.

Upgrading the Bootloader is only possible from BSP release 0.8.0 and higher.

Once you click "Burn Bootloader", you shouldn't close the Arduino IDE, unplug the Feather, or abort the process. There is a high chance it will brick your device! Do this with care and caution.

First select the Bootloader version that you want to upgrade under **Tools->Bootloader**. Then select **"Bootloader DFU for Bluefruit nRF52"**

Select **Tools->Burn Bootloader** to start the upgrade. After receiving the new Bootloader over the serial connection, the old Bootloader will erase itself! The new bootloader will then be flashed. The process typically takes 30-60 seconds to complete. Make sure you see the **"Device programmed"** in the output log before launching Serial monitor or uploading new sketch.

```

Starting DFU upgrade of type 3, SoftDevice size: 123012, bootloader size: 23072, application size: 0
Sending DFU start packet
Sending DFU init packet
Sending firmware file
*****
Activating new firmware
DFU upgrade took 27.3106541634s
Device programmed.

```

Flashing the Bootloader

All Adafruit nRF52 boards ship with the bootloader pre-flashed. This page is provided for information purposes only!

All Bluefruit nRF52 Feather boards and Bluefruit nRF52 modules ship with the serial bootloader pre-flashed, so this page is normally not required when setting your device and system up.

The information provided here is only intended for rare cases where you may want or need to reflash the bootloader yourself, and have access to the HW required to do so.

You will need a Segger J-Link to flash the bootloader to the nRF52832 SoC!

Third Party Tool Requirements

To burn the bootloader from within the Arduino IDE, you will need the following tools installed on your system and available in the system path:

JLink Drivers and Tools

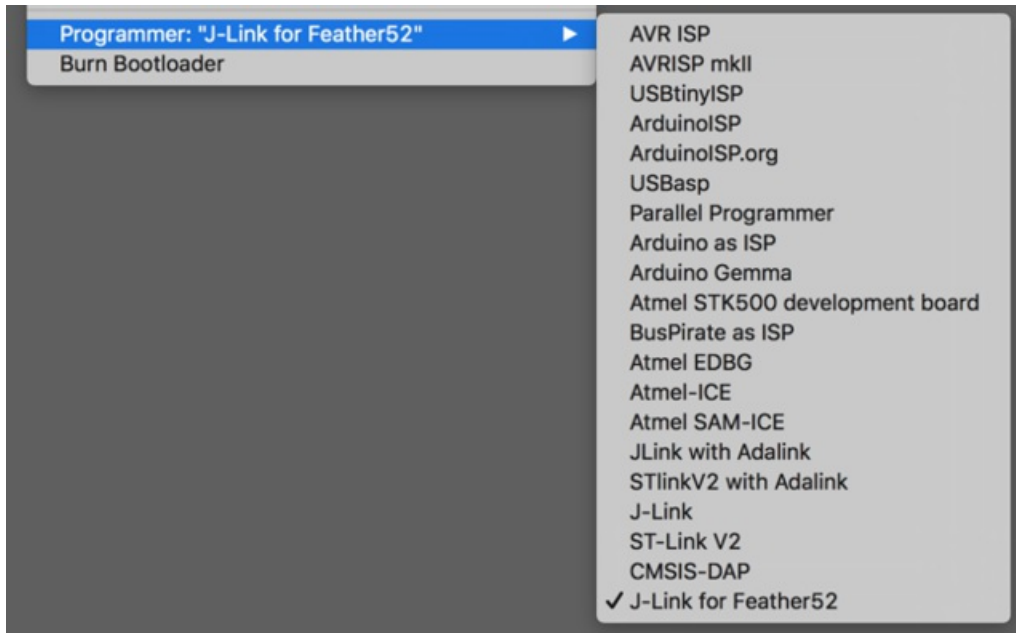

Download and install the [JLink Software and Documentation Pack](#) from Segger, which will also install a set of command line tools.

Burning the Bootloader from the Arduino IDE

Once the tools above have been installed and added to your system path, from the Arduino IDE:

- Select **Tools > Board > Adafruit Bluefruit Feather52**
- Select **Tools > Programmer > J-Link for Feather52**
- Select **Tools > Burn Bootloader** with the board and J-Link connected

The appropriate **Programmer** target and **Burn Bootloader** button can be seen below:

Manually Burning the Bootloader via nrfjprog

You can also manually burn the bootloader from the command line, using `nrfjprog` from Nordic.

You can either download [nRF5x-Command-Line-Tools](#) for OSX/Linux/Win32, or use the version that ships with the BSP in the `tools/nrf5x-command-line-tools` folder.

Run the following commands, updating the path to the .hex file as appropriate:

```
$ nrfjprog -e -f nrf52
$ nrfjprog --program bootloader_with_s132.hex -f nrf52
$ nrfjprog --reset -f nrf52
```

You should see something similar to the following output, followed by a fast blinky on the status LED to indicate that you are in DFU/bootloader mode since no user sketch was found after the device reset:

All commands below were run from 'tools/nrf5x-command-line-tools/osx/nrfjprog'

```
$ ./nrfjprog -e -f nrf52
Erasing code and UICR flash areas.
Applying system reset.

$ ./nrfjprog --program ../../../../bin/bootloader/bootloader_v050_s132_v201.hex -f nrf52
Parsing hex file.
Reading flash area to program to guarantee it is erased.
Checking that the area to write is not protected.
Programming device.

$ ./nrfjprog --reset -f nrf52
Applying system reset.
Run.
```

OS X Note: You may need to create a symlink in `/usr/local/bin` to the `nrfjprog` tool wherever you have added it. You can run the following command, for example:

```
$ ln -s $HOME/prog/nordic/nrfjprog/nrfjprog /usr/local/bin/nrfjprog
```

Manually Burning the Bootloader via AdaLink

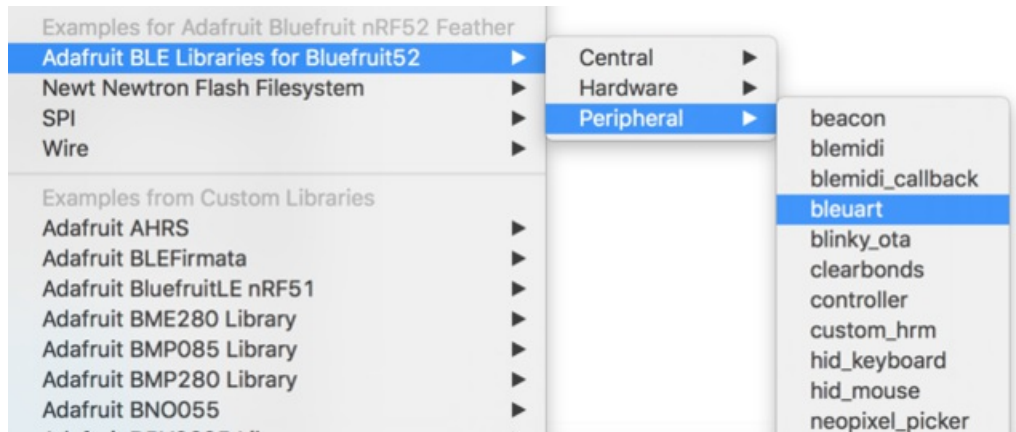

Alternatively, you can use [AdaLink](#) to flash the bootloader with a Segger J-Link:

```
# First erase the device's flash contents
$ adalink nrf52832 -p jlink -w

# Then flash the bootloader and SoftDevice .hex file
$ adalink nrf52832 -p jlink -h feather52_bootloader_v050_s132_v201.hex
```

Examples

There are numerous examples available for the Bluefruit nRF52 Feather in the **Examples** menu of the nRF52 BSP, and these are always up to date. You're first stop looking for example code should be there:

Example Source Code

The latest example source code is always available and visible on Github, and the public git repository should be considered the definitive source of example code for this board.

Click here to browse the example source code
on Github

<https://adafru.it/vaK>

Documented Examples

To help explain some common use cases for the nRF52 BLE API, feel free to consult the example documentation in this section of the learning guide:

- **Advertising: Beacon** - Shows how to use the BLEBeacon helper class to configure your Bluefruit nRF52 Feather as a beacon
- **BLE UART: Controller** - Shows how to use the **Controller** utility in our Bluefruit LE Connect apps to send basic data between your peripheral and your phone or tablet.
- **Custom: HRM** - Shows how to defined and work with a custom GATT Service and Characteristic, using the officially adopted Heart Rate Monitor (HRM) service as an example.
- **BLE Pin I/O (StandardFirmataBLE)** Shows how to control Pin I/O of nRF52 with Firmata protocol

Advertising: Beacon

This example shows how you can use the BLEBeacon helper class and advertising API to configure your Bluefruit nRF52 board as a 'Beacon'.

Complete Code

The code below may be out of sync with the latest examples on Github. You should always consult Github for the latest version.

The latest version of this code is available on [Github](#) and in the Examples menu.

```

#include <bluefruit.h>

// Beacon uses the Manufacturer Specific Data field in the advertising
// packet, which means you must provide a valid Manufacturer ID. Update
// the field below to an appropriate value. For a list of valid IDs see:
// https://www.bluetooth.com/specifications/assigned-numbers/company-identifiers
// 0x004C is Apple (for example)
#define MANUFACTURER_ID 0x004C

// AirLocate UUID: E2C56DB5-DFFB-48D2-B060-D0F5A71096E0
uint8_t beaconUuid[16] =
{
    0xE2, 0xC5, 0x6D, 0xB5, 0xDF, 0xFB, 0x48, 0xD2,
    0xB0, 0x60, 0xD0, 0xF5, 0xA7, 0x10, 0x96, 0xE0,
};

// A valid Beacon packet consists of the following information:
// UUID, Major, Minor, RSSI @ 1M
BLEBeacon beacon(beaconUuid, 0x0001, 0x0000, -54);

void setup()
{
    Serial.begin(115200);

    Serial.println("Bluefruit52 Beacon Example");

    Bluefruit.begin();
    Bluefruit.setName("Bluefruit52");

    // Manufacturer ID is required for Manufacturer Specific Data
    beacon.setManufacturer(MANUFACTURER_ID);

    // Setup the advertising packet
    setupAdv();

    // Start advertising
    Bluefruit.Advertising.start();
}

void setupAdv(void)
{
    // Set the beacon payload using the BLEBeacon class populated
    // earlier in this example
    Bluefruit.Advertising.setBeacon(beacon);

    // char* adv = Bluefruit.Advertising.getData();

    // There is no room left for 'Name' in the advertising packet
    // Use the optional secondary Scan Response packet for 'Name' instead
    Bluefruit.ScanResponse.addName();
}

void loop()
{
    // Toggle both LEDs every second
    digitalToggle(LED_BUILTIN);
    delay(1000);
}

```

Output

You can use the nRF Beacons application from Nordic Semiconductors to test this sketch:

- [nRF Beacons for iOS](#)
- [nRF Beacons for Android](#)

Make sure that you set the UUID, Major and Minor values to match the sketch above, and then run the sketch at the same time as the nRF Beacons application.

With the default setup you should see a Mona Lisa icon when the beacon is detected. If you don't see this, double check the UUID, Major and Minor values to be sure they match exactly.

BLE UART: Controller

This examples shows you you can use the BLEUart helper class and the Bluefruit LE Connect applications to send based keypad and sensor data to your nRF52.

Setup

In order to use this sketch, you will need to open Bluefruit LE Connect on your mobile device using our free [iOS](#), [Android](#) or [OS X](#) applications.

- Load the [Controller example sketch](#) in the Arduino IDE
- Compile the sketch and flash it to your nRF52 based Feather
- Once you are done uploading, open the **Serial Monitor** (Tools > Serial Monitor)
- Open the **Bluefruit LE Connect** application on your mobile device
- Connect to the appropriate target (probably 'Bluefruit52')
- Once connected switch to the **Controller** application inside the app
- Enable an appropriate control surface. The **Color Picker** control surface is shown below, for example (screen shot taken from the iOS application):

As you change the color (or as other data becomes available) you should receive the data on the nRF52, and see it in the Serial Monitor output:

Complete Code

The latest version of this code is always available on [Github](#), and in the **Examples** folder of the nRF52 BSP.

The code below is provided for convenience sake, but may be out of date! See the link above for the latest code.

```
#include <bluefruit.h>

BLEUart bleuart;

// Function prototypes for packetparser.cpp
uint8_t readPacket (BLEUart *ble_uart, uint16_t timeout);
float   parsefloat (uint8_t *buffer);
void    printHex   (const uint8_t * data, const uint32_t numBytes);

// Packet buffer
extern uint8_t packetbuffer[];

void setup(void)
{
  Serial.begin(115200);
  Serial.println(F("Adafruit Bluefruit52 Controller App Example"));
  Serial.println(F("-----"));

  Bluefruit.begin();
  Bluefruit.setName("Bluefruit52");

  // Configure and start the BLE Uart service
  bleuart.begin();

  // Set up the advertising packet
  setupAdv();

  // Start advertising
  Bluefruit.Advertising.start();
}

void setupAdv(void)
{
  Bluefruit.Advertising.addFlags(BLE_GAP_ADV_FLAGS_LE_ONLY_GENERAL_DISC_MODE);
  Bluefruit.Advertising.addTxPower();

  // Include the BLE UART (AKA 'NUS') 128-bit UUID
  Bluefruit.Advertising.addService(bleuart);
}
```

```

// There is no room for 'Name' in the Advertising packet
// Use the optional secondary Scan Response packet for 'Name' instead
Bluefruit.ScanResponse.addName();
}

/*****
/*!
  @brief Constantly poll for new command or response data
*/
*****/

void loop(void)
{
  // Wait for new data to arrive
  uint8_t len = readPacket(&bleuart, 500);
  if (len == 0) return;

  // Got a packet!
  // printHex(packetbuffer, len);

  // Color
  if (packetbuffer[1] == 'C') {
    uint8_t red = packetbuffer[2];
    uint8_t green = packetbuffer[3];
    uint8_t blue = packetbuffer[4];
    Serial.print ("RGB #");
    if (red < 0x10) Serial.print("0");
    Serial.print(red, HEX);
    if (green < 0x10) Serial.print("0");
    Serial.print(green, HEX);
    if (blue < 0x10) Serial.print("0");
    Serial.println(blue, HEX);
  }

  // Buttons
  if (packetbuffer[1] == 'B') {
    uint8_t buttnum = packetbuffer[2] - '0';
    boolean pressed = packetbuffer[3] - '0';
    Serial.print ("Button "); Serial.print(buttnum);
    if (pressed) {
      Serial.println(" pressed");
    } else {
      Serial.println(" released");
    }
  }

  // GPS Location
  if (packetbuffer[1] == 'L') {
    float lat, lon, alt;
    lat = parsefloat(packetbuffer+2);
    lon = parsefloat(packetbuffer+6);
    alt = parsefloat(packetbuffer+10);
    Serial.print("GPS Location\t");
    Serial.print("Lat: "); Serial.print(lat, 4); // 4 digits of precision!
    Serial.print('\t');
    Serial.print("Lon: "); Serial.print(lon, 4); // 4 digits of precision!
    Serial.print('\t');
    Serial.print(alt, 4); Serial.println(" meters");
  }

  // Accelerometer

```

```

    if (packetbuffer[1] == 'A') {
        float x, y, z;
        x = parsefloat(packetbuffer+2);
        y = parsefloat(packetbuffer+6);
        z = parsefloat(packetbuffer+10);
        Serial.print("Accel\t");
        Serial.print(x); Serial.print('\t');
        Serial.print(y); Serial.print('\t');
        Serial.print(z); Serial.println();
    }

    // Magnetometer
    if (packetbuffer[1] == 'M') {
        float x, y, z;
        x = parsefloat(packetbuffer+2);
        y = parsefloat(packetbuffer+6);
        z = parsefloat(packetbuffer+10);
        Serial.print("Mag\t");
        Serial.print(x); Serial.print('\t');
        Serial.print(y); Serial.print('\t');
        Serial.print(z); Serial.println();
    }

    // Gyroscope
    if (packetbuffer[1] == 'G') {
        float x, y, z;
        x = parsefloat(packetbuffer+2);
        y = parsefloat(packetbuffer+6);
        z = parsefloat(packetbuffer+10);
        Serial.print("Gyro\t");
        Serial.print(x); Serial.print('\t');
        Serial.print(y); Serial.print('\t');
        Serial.print(z); Serial.println();
    }

    // Quaternions
    if (packetbuffer[1] == 'Q') {
        float x, y, z, w;
        x = parsefloat(packetbuffer+2);
        y = parsefloat(packetbuffer+6);
        z = parsefloat(packetbuffer+10);
        w = parsefloat(packetbuffer+14);
        Serial.print("Quat\t");
        Serial.print(x); Serial.print('\t');
        Serial.print(y); Serial.print('\t');
        Serial.print(z); Serial.print('\t');
        Serial.print(w); Serial.println();
    }
}

```

You will also need the following helper class in a file called **packetParser.cpp**:

```

#include <string.h>
#include <Arduino.h>
#include <bluefruit.h>

#define PACKET_ACC_LEN          (15)

```

```

#define PACKET_GYRO_LEN           (15)
#define PACKET_MAG_LEN           (15)
#define PACKET_QUAT_LEN          (19)
#define PACKET_BUTTON_LEN        (5)
#define PACKET_COLOR_LEN         (6)
#define PACKET_LOCATION_LEN      (15)

// READ_BUFSIZE           Size of the read buffer for incoming packets
#define READ_BUFSIZE          (20)

/* Buffer to hold incoming characters */
uint8_t packetbuffer[READ_BUFSIZE+1];

/*****
 *!
 @brief Casts the four bytes at the specified address to a float
 */
/*****
float parseFloat(uint8_t *buffer)
{
    float f;
    memcpy(&f, buffer, 4);
    return f;
}

/*****
 *!
 @brief Prints a hexadecimal value in plain characters
 @param data      Pointer to the byte data
 @param numBytes  Data length in bytes
 */
/*****
void printHex(const uint8_t * data, const uint32_t numBytes)
{
    uint32_t szPos;
    for (szPos=0; szPos < numBytes; szPos++)
    {
        Serial.print(F("0x"));
        // Append leading 0 for small values
        if (data[szPos] <= 0xF)
        {
            Serial.print(F("0"));
            Serial.print(data[szPos] & 0xf, HEX);
        }
        else
        {
            Serial.print(data[szPos] & 0xff, HEX);
        }
        // Add a trailing space if appropriate
        if ((numBytes > 1) && (szPos != numBytes - 1))
        {
            Serial.print(F(" "));
        }
    }
    Serial.println();
}

/*****
 *!

```

```

/ ^!
@brief Waits for incoming data and parses it
*/
/*****
uint8_t readPacket(BLEUART *ble_uart, uint16_t timeout)
{
    uint16_t origtimeout = timeout, replyidx = 0;

    memset(packetbuffer, 0, READ_BUFSIZE);

    while (timeout--) {
        if (replyidx >= 20) break;
        if ((packetbuffer[1] == 'A') && (replyidx == PACKET_ACC_LEN))
            break;
        if ((packetbuffer[1] == 'G') && (replyidx == PACKET_GYRO_LEN))
            break;
        if ((packetbuffer[1] == 'M') && (replyidx == PACKET_MAG_LEN))
            break;
        if ((packetbuffer[1] == 'Q') && (replyidx == PACKET_QUAT_LEN))
            break;
        if ((packetbuffer[1] == 'B') && (replyidx == PACKET_BUTTON_LEN))
            break;
        if ((packetbuffer[1] == 'C') && (replyidx == PACKET_COLOR_LEN))
            break;
        if ((packetbuffer[1] == 'L') && (replyidx == PACKET_LOCATION_LEN))
            break;

        while (ble_uart->available()) {
            char c = ble_uart->read();
            if (c == '!') {
                replyidx = 0;
            }
            packetbuffer[replyidx] = c;
            replyidx++;
            timeout = origtimeout;
        }

        if (timeout == 0) break;
        delay(1);
    }

    packetbuffer[replyidx] = 0; // null term

    if (!replyidx) // no data or timeout
        return 0;
    if (packetbuffer[0] != '!') // doesn't start with '!' packet beginning
        return 0;

    // check checksum!
    uint8_t xsum = 0;
    uint8_t checksum = packetbuffer[replyidx-1];

    for (uint8_t i=0; i<replyidx-1; i++) {
        xsum += packetbuffer[i];
    }
    xsum = ~xsum;

    // Throw an error message if the checksum's don't match
    if (xsum != checksum)
    {

```

```
Serial.print("Checksum mismatch in packet : ");  
printHex(packetbuffer, replyidx+1);  
return 0;  
}  
  
// checksum passed!  
return replyidx;  
}
```

Custom: HRM

The `BLEService` and `BLECharacteristic` classes can be used to implement any custom or officially adopted BLE service of characteristic using a set of basic properties and callback handlers.

The example below shows how to use these classes to implement the [Heart Rate Monitor](#) service, as defined by the Bluetooth SIG.

HRM Service Definition

UUID: [0x180D](#)

Characteristic Name	UUID	Requirement	Properties
Heart Rate Measurement	0x2A37	Mandatory	Notify
Body Sensor Location	0x2A38	Optional	Read
Heart Rate Control Point	0x2A39	Conditional	Write

Only the first characteristic is mandatory, but we will also implement the optional **Body Sensor Location** characteristic. Heart Rate Control Point won't be used in this example to keep things simple.

Implementing the HRM Service and Characteristics

The core service and the first two characteristics can be implemented with the following code:

First, define the `BLEService` and `BLECharacteristic` variables that will be used in your project:

```
/* HRM Service Definitions
 * Heart Rate Monitor Service: 0x180D
 * Heart Rate Measurement Char: 0x2A37
 * Body Sensor Location Char: 0x2A38
 */
BLEService hrms = BLEService(UUID16_SVC_HEART_RATE);
BLECharacteristic hrmc = BLECharacteristic(UUID16_CHR_HEART_RATE_MEASUREMENT);
BLECharacteristic bslc = BLECharacteristic(UUID16_CHR_BODY_SENSOR_LOCATION);
```

Then you need to 'populate' those variables with appropriate values. For simplicity sake, you can define a custom function for your service where all of the code is placed, and then just call this function once in the 'setup' function:

```
void setupHRM(void)
{
  // Configure the Heart Rate Monitor service
  // See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.service.heart_rate_monitor
  // Supported Characteristics:
  // Name                UUID      Requirement Properties
  // -----
  // Heart Rate Measurement 0x2A37  Mandatory   Notify
  // Body Sensor Location   0x2A38  Optional    Read
  // Heart Rate Control Point 0x2A39  Conditional  Write      <-- Not used here
  hrms.begin();

  // Note: You must call .begin() on the BLEService before calling .begin() on
  // any characteristic(s) within that service definition.. Calling .begin() on
  // a BLECharacteristic will cause it to be added to the last BLEService that
  // was defined.
```

```

// was `begin()`ed!

// Configure the Heart Rate Measurement characteristic
// See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic
// Permission = Notify
// Min Len    = 1
// Max Len    = 8
//   B0       = UINT8 - Flag (MANDATORY)
//   b5:7     = Reserved
//   b4       = RR-Interval (0 = Not present, 1 = Present)
//   b3       = Energy expended status (0 = Not present, 1 = Present)
//   b1:2     = Sensor contact status (0+1 = Not supported, 2 = Supported but contact not detected, 3 =
//   b0       = Value format (0 = UINT8, 1 = UINT16)
//   B1       = UINT8 - 8-bit heart rate measurement value in BPM
//   B2:3     = UINT16 - 16-bit heart rate measurement value in BPM
//   B4:5     = UINT16 - Energy expended in joules
//   B6:7     = UINT16 - RR Interval (1/1024 second resolution)
hrmc.setProperties(CHR_PROPS_NOTIFY);
hrmc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
hrmc.setFixedLen(2);
hrmc.setCccdWriteCallback(cccd_callback); // Optionally capture CCCD updates
hrmc.begin();
uint8_t hrmdata[2] = { 0b00000110, 0x40 }; // Set the characteristic to use 8-bit values, with the sensor
hrmc.notify(hrmdata, 2); // Use .notify instead of .write!

// Configure the Body Sensor Location characteristic
// See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic
// Permission = Read
// Min Len    = 1
// Max Len    = 1
//   B0       = UINT8 - Body Sensor Location
//   0        = Other
//   1        = Chest
//   2        = Wrist
//   3        = Finger
//   4        = Hand
//   5        = Ear Lobe
//   6        = Foot
//   7:255    = Reserved
bslc.setProperties(CHR_PROPS_READ);
bslc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
bslc.setFixedLen(1);
bslc.begin();
bslc.write(2); // Set the characteristic to 'Wrist' (2)
}

```

Service + Characteristic Setup Code Analysis

1. The first thing to do is to call `.begin()` on the `BLEService` (`hrms` above). Since the UUID is set in the object declaration at the top of the sketch, there is normally nothing else to do with the `BLEService` instance.

You **MUST** call `.begin()` on the `BLEService` before adding any `BLECharacteristics`. Any `BLECharacteristic` will automatically be added to the last `BLEService` that was ``begin()`ed`!

2. Next, you can configure the **Heart Rate Measurement** characteristic (`hrmc` above). The values that you set for this

will depend on the characteristic definition, but for convenience sake we've documented the key information in the comments in the code above.

- `'hrmc.setProperties(CHR_PROPS_NOTIFY);'` - This sets the **PROPERTIES** value for the characteristic, which determines how the characteristic can be accessed. In this case, the Bluetooth SIG has defined the characteristic as **Notify**, which means that the peripheral will receive a request ('notification') from the Central when the Central wants to receive data using this characteristic.
- `'hrmc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);'` - This sets the security for the characteristic, and should normally be set to the values used in this example.
- `'hrmc.setFixedLen(2);'` - This tells the Bluetooth stack how many bytes the characteristic contains (normally a value between 1 and 20). In this case, we will use a fixed size of two bytes, so we call `.setFixedLen`. If the characteristic has a variable length, you would need to set the max size via `.setMaxLen`.
- `'hrmc.setCccdWriteCallback(cccd_callback);'` - This optional code sets the callback that will be fired when the CCCD record is updated by the central. This is relevant because the characteristic is setup with the **NOTIFY** property. When the Central sets to 'Notify' bit, it will write to the CCCD record, and you can capture this write even in the CCCD callback and turn the sensor on, for example, allowing you to save power by only turning the sensor on (and back off) when it is or isn't actually being used. For the implementation of the CCCD callback handler, see the full sample code at the bottom of this page.
- `'hrmc.begin();'` Once all of the properties have been set, you must call `.begin()` which will add the characteristic definition to the last **BLEService** that was `.begin()`ed'.

3. Optionally set an initial value for the characteristic(s), such as the following code that populates 'hrmc' with a correct values, indicating that we are providing 8-bit heart rate monitor values, that the Body Sensor Location characteristic is present, and setting the first heart rate value to 0x04:

Note that we use `.notify()` in the example above instead of `.write()`, since this characteristic is setup with the **NOTIFY** property which needs to be handled in a slightly different manner than other characteristics.

```
// Set the characteristic to use 8-bit values, with the sensor connected and detected
uint8_t hrmdata[2] = { 0b00000110, 0x40 };

// Use .notify instead of .write!
hrmc.notify(hrmdata, 2);
```

The CCCD callback handler has the following signature:

```

void cccd_callback(BLECharacteristic& chr, uint16_t cccd_value)
{
    // Display the raw request packet
    Serial.print("CCCD Updated: ");
    Serial.print(cccd_value);
    Serial.println("");

    // Check the characteristic this CCCD update is associated with in case
    // this handler is used for multiple CCCD records.
    if (chr.uuid == hrmc.uuid) {
        if (chr.notifyEnabled()) {
            Serial.println("Heart Rate Measurement 'Notify' enabled");
        } else {
            Serial.println("Heart Rate Measurement 'Notify' disabled");
        }
    }
}
}

```

4. Repeat the same procedure for any other BLECharacteristics in your service.

Full Sample Code

The full sample code for this example can be seen below, but this maybe be out of sync with the latest code available on Github. Please consult the [Github code](#) if you have any problems with the code below.

```

```

BLE Pin I/O

Firmata is a generic protocol for communicating with microcontrollers and controlling the board's pins such as setting the GPIO outputs and inputs, PWM output, analog reads, etc....

Setup

In order to run this demo, you will need to open Bluefruit LE Connect on your mobile device using our free [iOS](#), [Android](#) or [OS X](#) applications.

- Load the [StandardFirmataBLE example sketch](#) in the Arduino IDE
- Compile the sketch and flash it to your nRF52 based Feather
- Once you are done uploading, open the **Serial Monitor** (Tools > Serial Monitor)
- Open the **Bluefruit LE Connect** application on your mobile device
- Connect to the appropriate target (probably 'Bluefruit52')
- Once connected switch to the **Pin I/O** application inside the app

For more information using Pin I/O module, you could check out this tutorial here <https://learn.adafruit.com/bluefruit-le-connect-for-ios/pin-i-o>

Complete Code

The latest version of this code is always available on [Github](#), and in the **Examples** folder of the nRF52 BSP.

The code below is provided for convenience sake, but may be out of date! See the link above for the latest

```

Central BLEUART

This example shows you how to use Feather nRF52 as a **Central** to talk to other Bluefruit (nRF52 or nRF51) peripherals exposing the bleuart (AKA 'NUS') service.

Client Services

Since the Central role accesses the GATT server on the peripheral, we first need to declare a client bleuart instance using the **BLEClientUart** helper class. We can also conveniently read Device Information if **BLEClientDis** is also used.

```
BLEClientDis clientDis;  
BLEClientUart clientUart;
```

Before we can configure client services, **Bluefruit.begin()** must be called with at least 1 for the number of concurrent connections supported in central mode. Since we won't be running the nRF52 as a peripheral in this instance, we will set the peripheral count to 0:

```
// Initialize Bluefruit with maximum connections as Peripheral = 0, Central = 1  
Bluefruit.begin(0, 1);
```

Afterward this, the client service(s) must be initialized by calling their **begin()** function, and you can setup any callbacks that you wish to use from the helper class:

```
// Configure DIS client  
clientDis.begin();  
  
// Init BLE Central Uart Service  
clientUart.begin();  
clientUart.setRxCallback(bleuart_rx_callback);
```

Scanner

Let's start the advertising scanner to find a peripheral.

We'll hook up the scan result callback with **setRxCallback()**.

Whenever advertising data is found by the scanner, it will be passed to this callback handler, and we can examine the advertising data there, and only connect to peripheral(s) that advertise the bleuart service.

Note: If the peripheral has multiple services and bleuart is not included in the UUID list in the advertising packet, you could optionally use another check such as matching the MAC address, name checking, using "another service", etc.

Once we find a peripheral that we wish to communicate with, call **Bluefruit.Central.connect()** to establish connection with it:

```

void setup()
{
  // Other set up ....

  /* Start Central Scanning
   * - Enable auto scan if disconnected
   * - Interval = 100 ms, window = 80 ms
   * - Don't use active scan
   * - Start(timeout) with timeout = 0 will scan forever (until connected)
   */
  Bluefruit.Scanner.setRxCallback(scan_callback);
  Bluefruit.Scanner.restartOnDisconnect(true);
  Bluefruit.Scanner.setInterval(160, 80); // in unit of 0.625 ms
  Bluefruit.Scanner.useActiveScan(false);
  Bluefruit.Scanner.start(0); // // 0 = Don't stop scanning after n seconds
}

/**
 * Callback invoked when scanner pick up an advertising data
 * @param report Structural advertising data
 */
void scan_callback(ble_gap_evt_adv_report_t* report)
{
  // Check if advertising contain BleUart service
  if ( Bluefruit.Scanner.checkReportForService(report, clientUart) )
  {
    Serial.print("BLE UART service detected. Connecting ... ");

    // Connect to device with bleuart service in advertising
    Bluefruit.Central.connect(report);
  }
}

```

Central Role

You normally need to setup the Central mode device's **connect callback**, which fires when a connection is established/disconnected with a peripheral device. Alternatively you could poll the connection status with `connected()`, but callbacks help to simplify the code significantly:

```

// Callbacks for Central
Bluefruit.Central.setConnectCallback(connect_callback);
Bluefruit.Central.setDisconnectCallback(disconnect_callback);

```

In the connect callback, we will try to **discover** the bleuart service by browsing the GATT table of the peripheral. This will help to determine the handle values for characteristics (e.g TXD, RXD, etc.). This is all done by BLEClientUart's `.discover()`. Once the service is found, enable the TXD characteristic's CCCD to allow the peripheral to send data, and we are ready to send data back and forth between the devices:

```

void connect_callback(uint16_t conn_handle)
{
    Serial.println("Connected");

    Serial.print("Discovering DIS ... ");
    if ( clientDis.discover(conn_handle) )
    {
        Serial.println("Found it");
        char buffer[32+1];

        // read and print out Manufacturer
        memset(buffer, 0, sizeof(buffer));
        if ( clientDis.getManufacturer(buffer, sizeof(buffer)) )
        {
            Serial.print("Manufacturer: ");
            Serial.println(buffer);
        }

        // read and print out Model Number
        memset(buffer, 0, sizeof(buffer));
        if ( clientDis.getModel(buffer, sizeof(buffer)) )
        {
            Serial.print("Model: ");
            Serial.println(buffer);
        }

        Serial.println();
    }

    Serial.print("Discovering BLE Uart Service ... ");

    if ( clientUart.discover(conn_handle) )
    {
        Serial.println("Found it");

        Serial.println("Enable TXD's notify");
        clientUart.enableTXD();

        Serial.println("Ready to receive from peripheral");
    }else
    {
        Serial.println("Found NONE");

        // disconnect since we couldn't find bleuart service
        Bluefruit.Central.disconnect(conn_handle);
    }
}

```

Full Sample Code

The full sample code for this example can be seen below, but this maybe be out of sync with the latest code available on Github. Please consult the [Github code](#) if you have any problems with the code below.

```

#include <bluefruit.h>

BLEClientDis clientDis;
BLEClientUart clientUart;

```

```

void setup()
{
  Serial.begin(115200);

  Serial.println("Bluefruit52 Central BLEUART Example");
  Serial.println("-----\n");

  // Initialize Bluefruit with maximum connections as Peripheral = 0, Central = 1
  // SRAM usage required by SoftDevice will increase dramatically with number of connections
  Bluefruit.begin(0, 1);

  Bluefruit.setName("Bluefruit52 Central");

  // Configure DIS client
  clientDis.begin();

  // Init BLE Central Uart Service
  clientUart.begin();
  clientUart.setRxCallback(bleuart_rx_callback);

  // Increase Blink rate to different from PrPh advertising mode
  Bluefruit.setConnLedInterval(250);

  // Callbacks for Central
  Bluefruit.Central.setConnectCallback(connect_callback);
  Bluefruit.Central.setDisconnectCallback(disconnect_callback);

  /* Start Central Scanning
   * - Enable auto scan if disconnected
   * - Interval = 100 ms, window = 80 ms
   * - Don't use active scan
   * - Start(timeout) with timeout = 0 will scan forever (until connected)
   */
  Bluefruit.Scanner.setRxCallback(scan_callback);
  Bluefruit.Scanner.restartOnDisconnect(true);
  Bluefruit.Scanner.setInterval(160, 80); // in unit of 0.625 ms
  Bluefruit.Scanner.useActiveScan(false);
  Bluefruit.Scanner.start(0); // // 0 = Don't stop scanning after n seconds
}

/**
 * Callback invoked when scanner pick up an advertising data
 * @param report Structural advertising data
 */
void scan_callback(ble_gap_evt_adv_report_t* report)
{
  // Check if advertising contain BleUart service
  if ( Bluefruit.Scanner.checkReportForService(report, clientUart) )
  {
    Serial.print("BLE UART service detected. Connecting ... ");

    // Connect to device with bleuart service in advertising
    Bluefruit.Central.connect(report);
  }
}

/**
 * Callback invoked when an connection is established
 * @param conn handle

```

```

*/
void connect_callback(uint16_t conn_handle)
{
    Serial.println("Connected");

    Serial.print("Discovering DIS ... ");
    if ( clientDis.discover(conn_handle) )
    {
        Serial.println("Found it");
        char buffer[32+1];

        // read and print out Manufacturer
        memset(buffer, 0, sizeof(buffer));
        if ( clientDis.getManufacturer(buffer, sizeof(buffer)) )
        {
            Serial.print("Manufacturer: ");
            Serial.println(buffer);
        }

        // read and print out Model Number
        memset(buffer, 0, sizeof(buffer));
        if ( clientDis.getModel(buffer, sizeof(buffer)) )
        {
            Serial.print("Model: ");
            Serial.println(buffer);
        }

        Serial.println();
    }

    Serial.print("Discovering BLE Uart Service ... ");

    if ( clientUart.discover(conn_handle) )
    {
        Serial.println("Found it");

        Serial.println("Enable TXD's notify");
        clientUart.enableTXD();

        Serial.println("Ready to receive from peripheral");
    }else
    {
        Serial.println("Found NONE");

        // disconnect since we couldn't find bleuart service
        Bluefruit.Central.disconnect(conn_handle);
    }
}

/**
 * Callback invoked when a connection is dropped
 * @param conn_handle
 * @param reason
 */
void disconnect_callback(uint16_t conn_handle, uint8_t reason)
{
    (void) conn_handle;
    (void) reason;
}

```

```

    Serial.println("Disconnected");
}

/**
 * Callback invoked when uart received data
 * @param uart_svc Reference object to the service where the data
 * arrived. In this example it is clientUart
 */
void bleuart_rx_callback(BLEClientUart& uart_svc)
{
    Serial.print("[RX]: ");

    while ( uart_svc.available() )
    {
        Serial.print( (char) uart_svc.read() );
    }

    Serial.println();
}

void loop()
{
    if ( Bluefruit.Central.connected() )
    {
        // Not discovered yet
        if ( clientUart.discovered() )
        {
            // Discovered means in working state
            // Get Serial input and send to Peripheral
            if ( Serial.available() )
            {
                delay(2); // delay a bit for all characters to arrive

                char str[20+1] = { 0 };
                Serial.readBytes(str, 20);

                clientUart.print( str );
            }
        }
    }
}

```

Dual Roles BLEUART

If you are not familiar with Central Role, it is advised to look at the "Central BLEUART" example first then continue with this afterwards.

This example demonstrates how you can use a Feather nRF52 to connect to two other Bluefruit or BLE devices using the bleuart (AKA 'NUS') service concurrently, with the device running at both a peripheral and a central at the same time.

This dual role example acts as a BLE bridge that sits between a central and a peripheral forwarding bleuart messages back and forth, as shown in the image below:

Server & Client Service Setup

Since the Bluefruit device will act as both a central and a peripheral, we will need to declare both server and client instance of the bleuart helper class:

```
// Peripheral uart service
BLEUART bleuart;

// Central uart client
BLEClientUart clientUart;
```

Before we can configure client services, `Bluefruit.begin()` must be called with at least 1 for the number of concurrent connection for both peripheral and central mode:

```
// Initialize Bluefruit with max concurrent connections as Peripheral = 1, Central = 1
Bluefruit.begin(1, 1);
```

After this, client services must be initialized by calling their `begin()` function, followed by any callbacks that you wish to wire up as well:

```
// Configure and Start BLE Uart Service
bleuart.begin();
bleuart.setRxCallback(prph_bleuart_rx_callback);

// Init BLE Central Uart Service
clientUart.begin();
clientUart.setRxCallback(cent_bleuart_rx_callback);
```

We are then ready to forward data from central to peripheral and vice versa using callbacks:

```
void cent_bleuart_rx_callback(BLEClientUart& cent_uart)
{
    char str[20+1] = { 0 };
    cent_uart.read(str, 20);

    Serial.print("[Cent] RX: ");
    Serial.println(str);

    if ( bleuart.notifyEnabled() )
    {
        // Forward data from our peripheral to Mobile
        bleuart.print( str );
    }else
    {
        // response with no prph message
        clientUart.println("[Cent] Peripheral role not connected");
    }
}

void prph_bleuart_rx_callback(void)
{
    // Forward data from Mobile to our peripheral
    char str[20+1] = { 0 };
    bleuart.read(str, 20);

    Serial.print("[Prph] RX: ");
    Serial.println(str);

    if ( clientUart.discovered() )
    {
        clientUart.print(str);
    }else
    {
        bleuart.println("[Prph] Central role not connected");
    }
}
```

Peripheral Role

The first thing to do for the peripheral part of our code is to setup the **connect callback**, which fires when a connection is established/disconnected with the central. Alternatively you could poll the connection status with `connected()`, but callbacks helps to simplify the code significantly:

```
// Callbacks for Peripheral
Bluefruit.setConnectCallback(prph_connect_callback);
Bluefruit.setDisconnectCallback(prph_disconnect_callback);
```

Central Role

Next we setup the Central mode **connect callback**, which fires when a connection is established/disconnected with a peripheral device:

```
// Callbacks for Central
Bluefruit.Central.setConnectCallback(cent_connect_callback);
Bluefruit.Central.setDisconnectCallback(cent_disconnect_callback);
```

Advertising and Scanner

It is possible to start both the scanner and advertising at the same time so that we can discover and be discovered by other BLE devices. For the scanner, we use a filter that only fires the callback if a specific UUID is found in the advertising data of the peer device:

```
/* Start Central Scanning
 * - Enable auto scan if disconnected
 * - Interval = 100 ms, window = 80 ms
 * - Filter only accept bleuart service
 * - Don't use active scan
 * - Start(timeout) with timeout = 0 will scan forever (until connected)
 */
Bluefruit.Scanner.setRxCallback(scan_callback);
Bluefruit.Scanner.restartOnDisconnect(true);
Bluefruit.Scanner.setInterval(160, 80); // in unit of 0.625 ms
Bluefruit.Scanner.filterUuid(bleuart.uuid);
Bluefruit.Scanner.useActiveScan(false);
Bluefruit.Scanner.start(0); // 0 = Don't stop scanning after n seconds

// Advertising packet
Bluefruit.Advertising.addFlags(BLE_GAP_ADV_FLAGS_LE_ONLY_GENERAL_DISC_MODE);
Bluefruit.Advertising.addTxPower();

// Include bleuart 128-bit uuid
Bluefruit.Advertising.addService(bleuart);

// Secondary Scan Response packet (optional)
// Since there is no room for 'Name' in Advertising packet
Bluefruit.ScanResponse.addName();

/* Start Advertising
 * - Enable auto advertising if disconnected
 * - Interval: fast mode = 20 ms, slow mode = 152.5 ms
 * - Timeout for fast mode is 30 seconds
 * - Start(timeout) with timeout = 0 will advertise forever (until connected)
 *
 * For recommended advertising interval
 * https://developer.apple.com/library/content/qa/qa1931/_index.html
 */
Bluefruit.Advertising.restartOnDisconnect(true);
Bluefruit.Advertising.setInterval(32, 244); // in unit of 0.625 ms
Bluefruit.Advertising.setFastTimeout(30); // number of seconds in fast mode
Bluefruit.Advertising.start(0); // 0 = Don't stop advertising after n seconds
```

Full Sample Code

The full sample code for this example can be seen below, but this maybe be out of sync with the latest code available on Github. Please consult the [Github code](#) if you have any problems with the code below.

```
#include <bluefruit.h>
```

```

// Peripheral uart service
BLEUart bleuart;

// Central uart client
BLEClientUart clientUart;

void setup()
{
    Serial.begin(115200);

    Serial.println("Bluefruit52 Dual Role BLEUART Example");
    Serial.println("-----\n");

    // Initialize Bluefruit with max concurrent connections as Peripheral = 1, Central = 1
    // SRAM usage required by SoftDevice will increase with number of connections
    Bluefruit.begin(1, 1);
    // Set max power. Accepted values are: -40, -30, -20, -16, -12, -8, -4, 0, 4
    Bluefruit.setTxPower(4);
    Bluefruit.setName("Bluefruit52 duo");

    // Callbacks for Peripheral
    Bluefruit.setConnectCallback(prph_connect_callback);
    Bluefruit.setDisconnectCallback(prph_disconnect_callback);

    // Callbacks for Central
    Bluefruit.Central.setConnectCallback(cent_connect_callback);
    Bluefruit.Central.setDisconnectCallback(cent_disconnect_callback);

    // Configure and Start BLE Uart Service
    bleuart.begin();
    bleuart.setRxCallback(prph_bleuart_rx_callback);

    // Init BLE Central Uart Service
    clientUart.begin();
    clientUart.setRxCallback(cent_bleuart_rx_callback);

    /* Start Central Scanning
    * - Enable auto scan if disconnected
    * - Interval = 100 ms, window = 80 ms
    * - Filter only accept bleuart service
    * - Don't use active scan
    * - Start(timeout) with timeout = 0 will scan forever (until connected)
    */
    Bluefruit.Scanner.setRxCallback(scan_callback);
    Bluefruit.Scanner.restartOnDisconnect(true);
    Bluefruit.Scanner.setInterval(160, 80); // in unit of 0.625 ms
    Bluefruit.Scanner.filterUuid(bleuart.uuid);
    Bluefruit.Scanner.useActiveScan(false);
    Bluefruit.Scanner.start(0); // 0 = Don't stop scanning after n seconds

    // Set up and start advertising
    startAdv();
}

void startAdv(void)

```

Bluefruit nRF52 API

The Adafruit nRF52 core defines a number of custom classes that aim to make it easy to work with BLE in your projects.

The key classes are listed below, and examined in more detail elsewhere in this learning guide:

- **AdafruitBluefruit** is the main entry point to the Adafruit Bluefruit nRF52 API. This class exposes a number of essential functions and classes, such as advertising, the list of GATT services and characteristics defined on your device, and connection status.
- **BLEService** is a wrapper class for BLE GATT service records, and can be used to define custom service definitions, or acts as the base class for any service helper classes.
- **BLECharacteristic** is a wrapper class for a BLE GATT characteristic record, and can be used to define custom characteristics, or acts as the base class for any characteristic helper classes.
- **BLEDis** is a helper class for the DIS or 'Device Information Service'.
- **BLEUart** is a helper class for the NUS or 'Nordic UART Service'.
- **BLEBeacon** is a helper class to configure your nRF52 as a beacon using the advertising packet to send out properly formatted beacon data.
- **BLEMidi** is a helper class to work with MIDI data over BLE.
- **BLEHidAdafruit** is a helper class to emulate an HID mouse or keyboard over BLE.

Details on each of these helper classes are found further in this learning guide.

AdafruitBluefruit

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

This base class is the main entry point to the Adafruit Bluefruit nRF52 API, and exposes most of the helper classes and functions that you use to configure your device.

API

AdafruitBluefruit has the following public API:

```
// Constructor
AdafruitBluefruit(void);

/*-----*/
/* Lower Level Classes (Bluefruit.Advertising.*, etc.)
 *-----*/

BLEGap          Gap;
BLEGatt         Gatt;

BLEAdvertising  Advertising;
BLEAdvertisingData ScanResponse;
BLEScanner      Scanner;
BLECentral      Central;
BLEDiscovery     Discovery;

/*-----*/
/* SoftDevice Configure Functions, must call before begin().
 * These function affect the SRAM consumed by SoftDevice.
 *-----*/

void    configServiceChanged (bool    changed);
void    configUuid128Count   (uint8_t  uuid128_max);
void    configAttrTableSize  (uint32_t attr_table_size);

// Config Bandwidth for connections
void    configPrphConn       (uint16_t mtu_max, uint8_t event_len, uint8_t hvn_qsize, uint8_t wrCmd_qsize);
void    configCentralConn    (uint16_t mtu_max, uint8_t event_len, uint8_t hvn_qsize, uint8_t wrCmd_qsize);

// Convenient function to config connection
void    configPrphBandwidth  (uint8_t bw);
void    configCentralBandwidth(uint8_t bw);

err_t    begin(uint8_t prph_count = 1, uint8_t central_count = 0);

/*-----*/
/* General Functions
 *-----*/

void    setName              (const char* str);
uint8_t getName              (char* name, uint16_t bufsize);

bool    setTxPower           (int8_t power);
int8_t  getTxPower           (void);

bool    setAppearance        (uint16_t appear);
```

```

uint16_t getAperance      (void);

void    autoConnLed      (bool enabled);
void    setConnLedInterval (uint32_t ms);

/*-----*/
/* GAP, Connections and Bonding
 *-----*/
bool    connected        (void);
bool    disconnect        (void);

bool    setConnInterval   (uint16_t min, uint16_t max);
bool    setConnIntervalMS (uint16_t min_ms, uint16_t max_ms);

uint16_t connHandle       (void);
bool    connPaired        (void);
uint16_t connInterval     (void);

bool    requestPairing    (void);
void    clearBonds        (void);

ble_gap_addr_t getPeerAddr (void);
uint8_t        getPeerAddr (uint8_t addr[6]);

void    printInfo(void);

/*-----*/
/* Callbacks
 *-----*/
void setConnectCallback ( BLEGap::connect_callback_t fp);
void setDisconnectCallback( BLEGap::disconnect_callback_t fp);

```

These functions are generally available via '**Bluefruit.***'. For example, to check the connection status in your sketch you could run '`if (Bluefruit.connected()) { ... }`'.

Examples

For examples of how to work with the parent **Bluefruit** class, see the **Examples** section later in this guide. It's better to examine this class in the context of a real world use case.

You can also browse the latest example code online via Github:

Browse the latest example code on Github

<https://adafru.it/vaK>

BLEGap

This page is a work in progress as the API is changing as we migrate to S132v5 and add better Central mode support.

This GAP API for Bluefruit is accessible via `Bluefruit.Gap.***` and has the following public functions:

```
typedef void (*connect_callback_t) (uint16_t conn_handle);
typedef void (*disconnect_callback_t) (uint16_t conn_handle, uint8_t reason);

uint8_t      getAddr          (uint8_t mac[6]);
bool         setAddr          (uint8_t mac[6], uint8_t type);

bool         connected        (uint16_t conn_handle);

uint8_t      getRole          (uint16_t conn_handle);

uint8_t      getPeerAddr      (uint16_t conn_handle, uint8_t addr[6]);
ble_gap_addr_t getPeerAddr    (uint16_t conn_handle);
uint16_t     getPeerName      (uint16_t conn_handle, char* buf, uint16_t bufsize);

uint16_t     getMTU           (uint16_t conn_handle);
uint16_t     getMaxMtuByConnCfg (uint8_t conn_cfg);
uint16_t     getMaxMtu       (uint8_t conn_handle);
```

BLEAdvertising

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

'Advertising' is what makes your Bluetooth Low Energy devices visible to other devices in listening range. The radio sends out specially formatted advertising packets that contain information like the device name, whether you can connect to the device (or if it only advertises), etc.

You can also include custom data in the advertising packet, which is essential how beacons work.

The *BLEAdvertisingData* and *BLEAdvertising* classes expose a number of helper functions to make it easier to create well-formatted advertising packets, as well as to use the **Scan Response** option, which is an optional secondary advertising packet that can be requested by a Central device. (This gives you another 27 bytes of advertising data, but isn't sent out automatically like the main advertising packet.)

These two advertising packets are accessible via the parent AdafruitBluefruit class, calling '`Bluefruit.Advertising.*`' and '`Bluefruit.ScanResponse.*`' from your user sketches.

For examples of using these helper classes, see any of the **examples** later on in this guide, since all devices will advertise as part of the startup process.

API

The **BLEAdvertisingData** class has the following public API:

```

/*----- Adv Data -----*/
bool addData(uint8_t type, const void* data, uint8_t len);
bool addFlags(uint8_t flags);
bool addTxPower(void);
bool addName(void);
bool addAppearance(uint16_t appearance);
bool addManufacturerData(const void* data, uint8_t count);

/*----- UUID -----*/
bool addUuid(BLEUuid bleuuid);
bool addUuid(BLEUuid bleuuid1, BLEUuid bleuuid2);
bool addUuid(BLEUuid bleuuid1, BLEUuid bleuuid2, BLEUuid bleuuid3);
bool addUuid(BLEUuid bleuuid1, BLEUuid bleuuid2, BLEUuid bleuuid3, BLEUuid bleuuid4);

bool addUuid(BLEUuid bleuuid[], uint8_t count);

/*----- Service -----*/
bool addService(BLEService& service);
bool addService(BLEService& service1, BLEService& service2);
bool addService(BLEService& service1, BLEService& service2, BLEService& service3);
bool addService(BLEService& service1, BLEService& service2, BLEService& service3, BLEService& service4);

/*----- Client Service -----*/
bool addService(BLEClientService& service);

// Functions to work with the raw advertising packet
uint8_t count(void);
uint8_t* getData(void);
bool setData(const uint8_t* data, uint8_t count);
void clearData(void);

bool setData(Advertisable& adv_able) { return adv_able.setAdv(*this); }

```

In addition to API from BLEAdvertisingData, The **BLEAdvertising** class also has functions that dictate the behavior of advertising such as slow/fast timeout, adv intervals, and callbacks etc...

```

typedef void (*stop_callback_t) (void);
typedef void (*slow_callback_t) (void);

void setType(uint8_t adv_type);
void setFastTimeout(uint16_t sec);

void setSlowCallback(slow_callback_t fp);
void setStopCallback(stop_callback_t fp);

void setInterval (uint16_t fast, uint16_t slow);
void setIntervalMS(uint16_t fast, uint16_t slow);

uint16_t getInterval(void);

bool setBeacon(BLEBeacon& beacon);
bool setBeacon(EddyStoneUrl& eddy_url);

bool isRunning(void);

void restartOnDisconnect(bool enable);
bool start(uint16_t timeout = 0);
bool stop (void);

```

Related Information

- [Generic Access Profile](#): This page contains the official list of assigned numbers for the 'Data' type field. Data is inserted into the advertising packet by supplying a valid 'data' type, optionally followed by a properly formatted payload corresponding to the selected value.

Example

For practical example code, see the **Examples** section later on in this guide. The snippet below is provided for illustration purposes, but advertising should be examined in the context of a real use case since it varies from one setup to the next!

```

void setup(void)
{
  // Other startup code here
  // ...

  // Set up Advertising Packet
  setupAdv();

  // Start Advertising
  Bluefruit.Advertising.start();
}

void setupAdv(void)
{
  // Advertise as BLE only and general discoverable
  Bluefruit.Advertising.addFlags(BLE_GAP_ADV_FLAGS_LE_ONLY_GENERAL_DISC_MODE);

  // Add the TX Power to the advertising packet
  Bluefruit.Advertising.addTxPower();

  // Include bluetooth 128-bit uuid in the advertising packet
  Bluefruit.Advertising.addService(bluetooth);

  // There is no room for Name in Advertising packet
  // Use Scan response to store it instead
  Bluefruit.ScanResponse.addName();
}

```

BLEScanner

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

This documentation is based on BSP 0.7.0 and higher. Please make sure you have an up to date version before using the code below.

The BLEScanner class is used in **Central Mode**, and facilitates scanning for BLE peripherals in range and parsing the advertising data that is being sent out by the peripherals.

The BLEScanner class is normally accessed via the Bluefruit class (instantiated at startup), as shown below:

```
/* Start Central Scanning
 * - Enable auto scan if disconnected
 * - Filter for devices with a min RSSI of -80 dBm
 * - Interval = 100 ms, window = 50 ms
 * - Use active scan (requests the optional scan response packet)
 * - Start(0) = will scan forever since no timeout is given
 */
Bluefruit.Scanner.setRxCallback(scan_callback);
Bluefruit.Scanner.restartOnDisconnect(true);
Bluefruit.Scanner.filterRssi(-80);           // Only invoke callback when RSSI >= -80 dBm
Bluefruit.Scanner.setInterval(160, 80);     // in units of 0.625 ms
Bluefruit.Scanner.useActiveScan(true);      // Request scan response data
Bluefruit.Scanner.start(0);                 // 0 = Don't stop scanning after n seconds
```

API

BLEScanner has the following public API:

```

typedef void (*rx_callback_t) (ble_gap_evt_adv_report_t*);
typedef void (*stop_callback_t) (void);

BLEScanner(void);

ble_gap_scan_params_t* getParams(void);
bool isRunning(void);

void useActiveScan(bool enable);
void setInterval(uint16_t interval, uint16_t window);
void setIntervalMS(uint16_t interval, uint16_t window);
void restartOnDisconnect(bool enable);

void filterRssi(int8_t min_rssi);
void filterMSD(uint16_t manuf_id);

void filterUuid(BLEUuid ble_uuid);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2, BLEUuid ble_uuid3);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2, BLEUuid ble_uuid3, BLEUuid ble_uuid4);
void filterUuid(BLEUuid ble_uuid[], uint8_t count);

void clearFilters(void);

bool start(uint16_t timeout = 0);
bool stop(void);

/*----- Callbacks -----*/
void setRxCallback(rx_callback_t fp);
void setStopCallback(stop_callback_t fp);

/*----- Data Parser -----*/
uint8_t parseReportByType(const uint8_t* scandata, uint8_t scanlen, uint8_t type, uint8_t* buf, uint8_t buflen);
uint8_t parseReportByType(const ble_gap_evt_adv_report_t* report, uint8_t type, uint8_t* buf, uint8_t buflen);

bool checkReportForUuid(const ble_gap_evt_adv_report_t* report, BLEUuid ble_uuid);
bool checkReportForService(const ble_gap_evt_adv_report_t* report, BLEClientService svc);
bool checkReportForService(const ble_gap_evt_adv_report_t* report, BLEService svc);

```

setRxCallback(rx_callback_t fp)

Whenever a valid advertising packet is detected (based on any optional filters that are applied in the BLEScanner class), a dedicated callback function (see `rx_callback_t`) will be called.

The callback function has the following signature:

NOTE: `ble_gap_evt_adv_report_t` is part of the Nordic nRF52 SDK and is defined in `ble_gap.h`.

```

void scan_callback(ble_gap_evt_adv_report_t* report)
{
    /* Display the timestamp and device address */
    if (report->scan_rsp)
    {
        /* This is a Scan Response packet */
        Serial.printf("[SR%10d] Packet received from ", millis());
    }
}

```

```

else
{
    /* This is a normal advertising packet */
    Serial.printf("[ADV%9d] Packet received from ", millis());
}
Serial.printBuffer(report->peer_addr.addr, 6, ':');
Serial.print("\n");

/* Raw buffer contents */
Serial.printf("%14s %d bytes\n", "PAYLOAD", report->dlen);
if (report->dlen)
{
    Serial.printf("%15s", " ");
    Serial.printBuffer(report->data, report->dlen, '-');
    Serial.println();
}

/* RSSI value */
Serial.printf("%14s %d dBm\n", "RSSI", report->rssi);

/* Adv Type */
Serial.printf("%14s ", "ADV TYPE");
switch (report->type)
{
    case BLE_GAP_ADV_TYPE_ADV_IND:
        Serial.printf("Connectable undirected\n");
        break;
    case BLE_GAP_ADV_TYPE_ADV_DIRECT_IND:
        Serial.printf("Connectable directed\n");
        break;
    case BLE_GAP_ADV_TYPE_ADV_SCAN_IND:
        Serial.printf("Scannable undirected\n");
        break;
    case BLE_GAP_ADV_TYPE_ADV_NONCONN_IND:
        Serial.printf("Non-connectable undirected\n");
        break;
}

/* Check for BLE UART UUID */
if ( Bluefruit.Scanner.checkReportForUuid(report, BLEUART_UUID_SERVICE) )
{
    Serial.printf("%14s %s\n", "BLE UART", "UUID Found!");
}

/* Check for DIS UUID */
if ( Bluefruit.Scanner.checkReportForUuid(report, UUID16_SVC_DEVICE_INFORMATION) )
{
    Serial.printf("%14s %s\n", "DIS", "UUID Found!");
}

Serial.println();
}

```

`void useActiveScan(bool enable);`

Enabling 'Active Scan' by setting the `enable` parameter to 1 will cause the device to request the optional **Scan Response** advertising packet, which is a second 31 byte advertising packet that can be used to transmit additional

information.

By default active scanning is disabled, so no Scan Response packets will be received by BLEScanner unless this function is called and set to 1 before calling `Bluefruit.Scanner.start(0)`.

```
void filterRssi(int8_t min_rssi);
void filterMSD(uint16_t manuf_id);
void filterUuid(BLEUuid ble_uuid);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2, BLEUuid ble_uuid3);
void filterUuid(BLEUuid ble_uuid1, BLEUuid ble_uuid2, BLEUuid ble_uuid3, BLEUuid ble_uuid4);
void filterUuid(BLEUuid ble_uuid[], uint8_t count);
```

Filters can be applied to BLEScanner to narrow down the data sent to the callback handler, and make processing advertising packets easier for you.

As of BSP 0.7.0 the following three filters are present:

- `filterRssi(int8_t min_rssi)` : Filters advertising results to devices with at least the specified RSSI value, which allows you to ignore devices that are too far away or whose signal is too weak. The higher the number, the stronger the signal so -90 is a very weak signal, and -60 is a much stronger one.
- `filterUuid(BLEUuid ble_uuid)` : Filters advertising results to devices that advertise themselves as having the specified service UUID. If multiple UUIDs are entered, they will be filtered with boolean OR logic, meaning any single UUID present will be considered a match.
- `void filterMSD(uint16_t manuf_id)` : Filters advertising results to devices that contain a Manufacturer Specific Data data type, and who use the specified Bluetooth Customer ID (`manuf_id`). This can be useful to filter iBeacon versus Eddystone devices, for example, which both used the MSD field, or to look for custom MSD data matching your own CID.

When multiple UUIDs are added via one of the `.filterUuid(...)` functions, they UUIDs will be filtered using boolean 'OR' logic, meaning that the callback will fire when ANY of the specified UUIDs are detected in the advertising packet.

```
void clearFilters(void);
```

This function clears and filter values set using the functions above.

```
bool start(uint16_t timeout = 0);
bool stop(void);
```

The `.start` and `.stop` functions can be used to start and stop scanning, and should be called after all of the main parameters (timing, filters, etc.) have been set.

The `.start` function has a single parameter called timeout, which sets the number of seconds to scan for advertising packets. Setting this to '0' (the default value) will cause the device to scan forever.

Make sure you set any filters of BLEScanner parameters before calling `.start!`

`void restartOnDisconnect(bool enable);`

Setting this function to '1' will cause the scanning process to start again as soon as you disconnect from a peripheral device. The default behaviour is to automatically restart scanning on disconnect.

Examples

For an example that uses almost all of the BLEScanner and advertising API in Central mode, see [central_scan_advanced.ino](#) in the Central examples folder.

[central_scan_advanced.ino on Github](#)

<https://adafru.it/y5a>

This example is only available in BSP 0.7.0 and higher!

BLEService

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

This base class is used when defining custom BLE Gatt Services, such as the various service helper classes that make up the Adafruit Bluefruit nRF52 API described here.

Unless you are implementing a custom GATT service and characteristic, you normally won't use this base class directly, and would instantiate and call a higher level helper service or characteristic included in the Bluefruit nRF52 API.

Basic Usage

There are normally only two operation required to use the BLEService class:

You need to declare and instantiate the class with an appropriate 16-bit or 128-bit UUID in the constructor:

```
BLEService myService = BLEService(0x1234);
```

You then need to call the `.begin()` method on the instance before adding any BLECharacteristics to it (via the BLECharacteristic's respective `.begin()` function call):

```
myService.begin();
```

Order of Operations (Important!)

One very important thing to take into consideration when working with BLEService and BLECharacteristic, is that any BLECharacteristic will automatically be added to the last BLEService that had it's `.begin()` function called. As such, you **must call `yourService.begin()` before adding any characteristics!**

See the example at the bottom of this page for a concrete example of how this works in practice.

API

BLEService has the following overall class structure:

This documentation may be slightly out of date as bugs are fixed, and the API develops. You should always consult the Github repo for the definitive latest code release and class definitions!

```

BLEUuid uuid;

static BLEService* lastService;

BLEService(void);
BLEService(uint16_t uuid16);
BLEService(uint8_t const uuid128[]);

void setUuid(uint16_t uuid16);
void setUuid(uint8_t const uuid128[]);

virtual err_t begin(void);

```

Example

The following example declares a HRM (Heart Rate Monitor) service, and assigns some characteristics to it:

Note that this example code is incomplete. For the full example open the 'custom_hrm' example that is part of the nRF52 BSP! The code below is for illustration purposes only.

```

/* HRM Service Definitions
 * Heart Rate Monitor Service: 0x180D
 * Heart Rate Measurement Char: 0x2A37
 * Body Sensor Location Char: 0x2A38
 */
BLEService hrms = BLEService(UUID16_SVC_HEART_RATE);
BLECharacteristic hrmc = BLECharacteristic(UUID16_CHR_HEART_RATE_MEASUREMENT);
BLECharacteristic bslc = BLECharacteristic(UUID16_CHR_BODY_SENSOR_LOCATION);

void setupHRM(void)
{
    // Configure the Heart Rate Monitor service
    // See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.service.heart_rate_monitor
    // Supported Characteristics:
    // Name                UUID          Requirement Properties
    // -----
    // Heart Rate Measurement    0x2A37    Mandatory    Notify
    // Body Sensor Location      0x2A38    Optional     Read
    // Heart Rate Control Point  0x2A39    Conditional  Write        <-- Not used here
    hrms.begin();

    // Note: You must call .begin() on the BLEService before calling .begin() on
    // any characteristic(s) within that service definition.. Calling .begin() on
    // a BLECharacteristic will cause it to be added to the last BLEService that
    // was 'begin()'ed!

    // Configure the Heart Rate Measurement characteristic
    // See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.heart_rate_measurement
    // Permission = Notify
    // Min Len = 1
    // Max Len = 8
    // B0 = UINT8 - Flag (MANDATORY)
    // b5:7 = Reserved
    // b4 = RR-Internal (0 = Not present, 1 = Present)
    // b3 = Energy expended status (0 = Not present, 1 = Present)
    // b1:2 = Sensor contact status (0 = Not supported, 1 = Supported but contact not detected, 2 = Supported and contact detected)

```

```

//      D1:2 = Sensor contact status (0+1 = Not supported, 2 = Supported but contact not detected, 3 =
//      b0    = Value format (0 = UINT8, 1 = UINT16)
//      B1    = UINT8 - 8-bit heart rate measurement value in BPM
//      B2:3  = UINT16 - 16-bit heart rate measurement value in BPM
//      B4:5  = UINT16 - Energy expended in joules
//      B6:7  = UINT16 - RR Interval (1/1024 second resolution)
hrmc.setProperties(CHR_PROPS_NOTIFY);
hrmc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
hrmc.setFixedLen(2);
hrmc.setCccdWriteCallback(cccd_callback); // Optionally capture CCCD updates
hrmc.begin();
uint8_t hrmdata[2] = { 0b00000110, 0x40 }; // Set the characteristic to use 8-bit values, with the sen
hrmc.notify(hrmdata, 2); // Use .notify instead of .write!

// Configure the Body Sensor Location characteristic
// See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteris
// Permission = Read
// Min Len    = 1
// Max Len    = 1
//      B0    = UINT8 - Body Sensor Location
//      0     = Other
//      1     = Chest
//      2     = Wrist
//      3     = Finger
//      4     = Hand
//      5     = Ear Lobe
//      6     = Foot
//      7:255 = Reserved
bslc.setProperties(CHR_PROPS_READ);
bslc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
bslc.setFixedLen(1);
bslc.begin();
bslc.write(2); // Set the characteristic to 'Wrist' (2)
}

void cccd_callback(BLECharacteristic& chr, uint16_t cccd_value)
{
    // Display the raw request packet
    Serial.print("CCCD Updated: ");
    //Serial.printBuffer(request->data, request->len);
    Serial.print(cccd_value);
    Serial.println("");

    // Check the characteristic this CCCD update is associated with in case
    // this handler is used for multiple CCCD records.
    if (chr.uuid == hrmc.uuid) {
        if (chr.notifyEnabled()) {
            Serial.println("Heart Rate Measurement 'Notify' enabled");
        } else {
            Serial.println("Heart Rate Measurement 'Notify' disabled");
        }
    }
}
}

```

BLECharacteristic

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

This base class is used when defining custom BLE GATT characteristics, and is used throughout the Adafruit Bluefruit nRF52 API and helper classes.

Unless you are implementing a custom GATT service and characteristic, you normally won't use this base class directly, and would instantiate and call a higher level helper service or characteristic included in the Bluefruit nRF52 API.

Basic Usage

There are two main steps to using the BLECharacteristic class.

First, you need to declare and instantiate your BLECharacteristic class with a 16-bit or 128-bit UUID:

```
BLECharacteristic myChar = BLECharacteristic(0xABCD);
```

Then you need to set the relevant properties for the characteristic, with the following values at minimum:

```
myChar.setProperties(CHR_PROPS_READ);  
myChar.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);  
myChar.setFixedLen(1); // Alternatively .setMaxLen(uint16_t len)  
myChar.begin();
```

- **.setProperties** can be set to one or more of the following macros, which correspond to a single bit in the eight bit 'properties' field for the characteristic definition:
 - CHR_PROPS_BROADCAST = bit(0),
 - CHR_PROPS_READ = bit(1),
 - CHR_PROPS_WRITE_WO_RESP = bit(2),
 - CHR_PROPS_WRITE = bit(3),
 - CHR_PROPS_NOTIFY = bit(4),
 - CHR_PROPS_INDICATE = bit(5)
- **.setPermission** sets the security level for the characteristic, where the first value sets the read permissions, and the second value sets the write permissions, where both fields can have one of the following values:
 - SECMODE_NO_ACCESS = 0x00,
 - SECMODE_OPEN = 0x11,
 - SECMODE_ENC_NO_MITM = 0x21,
 - SECMODE_ENC_WITH_MITM = 0x31,
 - SECMODE_SIGNED_NO_MITM = 0x12,
 - SECMODE_SIGNED_WITH_MITM = 0x22
- **.setFixedLen()** indicates how many bytes this characteristic has. For characteristics that use 'notify' or 'indicate' this value can be from 1..20, other characteristic types can be set from 1..512 and values >20 bytes will be sent across multiple 20 byte packets. If the characteristic has a variable len, you set the **.setMaxLen()** value to the

maximum value it will hold (up to 20 bytes).

- `.begin()` will cause this characteristic to be added to the last `BLEService` that had its `.begin()` method called.

Order of Operations (Important!)

One very important thing to take into consideration when working with `BLEService` and `BLECharacteristic`, is that any `BLECharacteristic` will automatically be added to the last `BLEService` that had its `.begin()` function called. As such, you **must call `yourService.begin()` before adding any characteristics!**

See the example at the bottom of this page for a concrete example of how this works in practice.

API

`BLECharacteristic` has the following overall class structure:

This documentation may be slightly out of date as bugs are fixed, and the API develops. You should always consult the Github repo for the definitive latest code release and class definitions!

```
/*----- Callback Signatures -----*/
typedef void (*read_authorize_cb_t) (BLECharacteristic& chr, ble_gatts_evt_read_t * request);
typedef void (*write_authorize_cb_t) (BLECharacteristic& chr, ble_gatts_evt_write_t* request);
typedef void (*write_cb_t) (BLECharacteristic& chr, uint8_t* data, uint16_t len, uint16_t offset);
typedef void (*write_cccd_cb_t) (BLECharacteristic& chr, uint16_t value);

BLEUuid uuid;

// Constructors
BLECharacteristic(void);
BLECharacteristic(BLEUuid bleuuid);

// Destructor
virtual ~BLECharacteristic();

BLEService& parentService(void);

void setTempMemory(void);

/*----- Configure -----*/
void setUuid(BLEUuid bleuuid);
void setProperties(uint8_t prop);
void setPermission(BleSecurityMode read_perm, BleSecurityMode write_perm);

bool notify(const void* data, uint16_t len);
bool notify(const char* str);

bool notify(int      num);
bool notify(uint32_t num);
bool notify(uint16_t num);
bool notify(uint8_t  num);

```

Example

The following example configures an instance of the Heart Rate Monitor (HRM) Service and it's related characteristics:

Note that this example code is incomplete. For the full example open the 'custom_hrm' example that is part of the nRF52 BSP! The code below is for illustration purposes only.

```

/* HRM Service Definitions
 * Heart Rate Monitor Service: 0x180D
 * Heart Rate Measurement Char: 0x2A37
 * Body Sensor Location Char: 0x2A38
 */
BLEService hrms = BLEService(UUID16_SVC_HEART_RATE);
BLECharacteristic hrmc = BLECharacteristic(UUID16_CHR_HEART_RATE_MEASUREMENT);
BLECharacteristic bslc = BLECharacteristic(UUID16_CHR_BODY_SENSOR_LOCATION);

void setupHRM(void)
{
    // Configure the Heart Rate Monitor service
    // See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.service.heart_rate_monitor
    // Supported Characteristics:
    // Name                      UUID          Requirement Properties
    //

```

```

// -----
// Heart Rate Measurement      0x2A37 Mandatory  Notify
// Body Sensor Location        0x2A38 Optional   Read
// Heart Rate Control Point    0x2A39 Conditional Write    <-- Not used here
hrms.begin();

// Note: You must call .begin() on the BLEService before calling .begin() on
// any characteristic(s) within that service definition.. Calling .begin() on
// a BLECharacteristic will cause it to be added to the last BLEService that
// was 'begin()'ed!

// Configure the Heart Rate Measurement characteristic
// See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic
// Permission = Notify
// Min Len    = 1
// Max Len    = 8
// B0        = UINT8 - Flag (MANDATORY)
// b5:7      = Reserved
// b4        = RR-Interval (0 = Not present, 1 = Present)
// b3        = Energy expended status (0 = Not present, 1 = Present)
// b1:2      = Sensor contact status (0+1 = Not supported, 2 = Supported but contact not detected, 3 =
// b0        = Value format (0 = UINT8, 1 = UINT16)
// B1        = UINT8 - 8-bit heart rate measurement value in BPM
// B2:3      = UINT16 - 16-bit heart rate measurement value in BPM
// B4:5      = UINT16 - Energy expended in joules
// B6:7      = UINT16 - RR Interval (1/1024 second resolution)
hrmc.setProperties(CHR_PROPS_NOTIFY);
hrmc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
hrmc.setFixedLen(2);
hrmc.setCccdWriteCallback(cccd_callback); // Optionally capture CCCD updates
hrmc.begin();
uint8_t hrmdata[2] = { 0b00000110, 0x40 }; // Set the characteristic to use 8-bit values, with the sensor
hrmc.notify(hrmdata, 2); // Use .notify instead of .write!

// Configure the Body Sensor Location characteristic
// See: https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic
// Permission = Read
// Min Len    = 1
// Max Len    = 1
// B0        = UINT8 - Body Sensor Location
// 0         = Other
// 1         = Chest
// 2         = Wrist
// 3         = Finger
// 4         = Hand
// 5         = Ear Lobe
// 6         = Foot
// 7:255    = Reserved
bslc.setProperties(CHR_PROPS_READ);
bslc.setPermission(SECMODE_OPEN, SECMODE_NO_ACCESS);
bslc.setFixedLen(1);
bslc.begin();
bslc.write(2); // Set the characteristic to 'Wrist' (2)
}

void cccd_callback(BLECharacteristic& chr, uint16_t cccd_value)
{
    // Display the raw request packet
    Serial.print("CCCD Updated: ");
    //Serial.printBuffer(request->data, request->len);

```

```
Serial.print(cccd_value);
Serial.println("");

// Check the characteristic this CCCD update is associated with in case
// this handler is used for multiple CCCD records.
if (chr.uuid == hrmc.uuid) {
  if (chr.notifyEnabled()) {
    Serial.println("Heart Rate Measurement 'Notify' enabled");
  } else {
    Serial.println("Heart Rate Measurement 'Notify' disabled");
  }
}
}
```

BLEDiscovery

This page is a work in progress as the API is changing as we migrate to S132v5 and add better Central mode support.

BLEDiscovery is a helper class to make finding characteristics on a Gatt server (hosted on a BLE peripheral) easier. For service discovery, the BLEClientService's `discover()` API must be used, as shown below:

API

```
BLEDiscovery(void); // Constructor

void    begin(void);
bool    begun(void);

void    setHandleRange(ble_gattc_handle_range_t handle_range);
ble_gattc_handle_range_t getHandleRange(void);

uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic* chr[], uint8_t count);
uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic& chr1);
uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic& chr1, BLEClientCharacteristic& chr2);
uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic& chr1, BLEClientCharacteristic& chr2, BLEClientCharacteristic& chr3);
uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic& chr1, BLEClientCharacteristic& chr2, BLEClientCharacteristic& chr3, BLEClientCharacteristic& chr4);
uint8_t discoverCharacteristic(uint16_t conn_handle, BLEClientCharacteristic& chr1, BLEClientCharacteristic& chr2, BLEClientCharacteristic& chr3, BLEClientCharacteristic& chr4, BLEClientCharacteristic& chr5);
```

For concrete examples of how to use this API see the 'Central' folder in the examples that are part of the BSP.

BLEDis

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

This helper class acts as a wrapper for the Bluetooth [Device Information Service](#) (0x180A). This official GATT service allows you to publish basic information about your device in a generic manner.

The Bluefruit BLEDis helper class exposes the following characteristics:

- [Model Number String](#) (0x2A24), exposed via `.setModel(const char*)`
- [Serial Number String](#) (0x2A25), private
- [Firmware Revision String](#) (0x2A26), private
- [Hardware Revision String](#) (0x2A27), exposed via `.setHardwareRev(const char*)`
- [Software Revision String](#) (0x2A28), exposed via `.setSoftwareRev(const char*)`
- [Manufacturer Name String](#) (0x2A29), exposed via `.setManufacturer(const char*)`

The **Serial Number String** is private and is populated with a unique device ID that nRF52832 SoCs are programmed with during manufacturing.

The **Firmware Revision String** is also private and is populated with the following fields (to help us track issues and offer better feedback in the support forums):

- Softdevice Name (Sxxx)
- Softdevice Version (x.x.x)
- Bootloader Version (x.x.x)

Note: The Softdevice and Bootloader fields are separated by a single comma, meaning the final output will resemble the following string: 'S132 2.0.1, 0.5.0'

The remaining characteristics are all public and can be set to an value (up to 20 chars in length) using the appropriate helper function, but they have the following default values:

- **Model Number String:** Bluefruit Feather 52
- **Hardware Revision String:** NULL
- **Software Revision String:** The nRF52 BSP version number
- **Manufacturer Name String:** Adafruit Industries

Setting a public value to NULL will prevent the characteristic from being present in the DIS service.

API

The following functions and constructors are defined in the BLEDis class:

```

BLEDis(void);

void setModel(const char* model);
void setHardwareRev(const char* hw_rev);
void setSoftwareRev(const char* sw_rev);
void setManufacturer(const char* manufacturer);

err_t begin(void);

```

The individual characteristic values are set via the `.set*()` functions above, and when all values have been set you call the `.begin()` function to add the service to the device's internal GATT registry.

Example

The following bare bones examples show how to setup the device information service with user-configurable strings for values:

```

#include <bluefruit.h>

BLEDis bledis;

void setup()
{
    Serial.begin(115200);

    Serial.println("Bluefruit52 DIS Example");

    Bluefruit.begin();
    Bluefruit.setName("Bluefruit52");

    // Configure and Start Device Information Service
    bledis.setManufacturer("Adafruit Industries");
    bledis.setModel("Bluefruit Feather52");
    bledis.begin();

    // Set up Advertising Packet
    setupAdv();

    // Start Advertising
    Bluefruit.Advertising.start();
}

void setupAdv(void)
{
    Bluefruit.Advertising.addFlags(BLE_GAP_ADV_FLAGS_LE_ONLY_GENERAL_DISC_MODE);
    Bluefruit.Advertising.addTxPower();

    // There isn't enough room in the advertising packet for the
    // name so we'll place it on the secondary Scan Response packet
    Bluefruit.ScanResponse.addName();
}

void loop()
{
}

```

Output

If you examine the device using the Bluefruit LE Connect app on iOS, Android or OS X you should see something resembling the following output:

UUID	Value
▼ Device Information	
Model Number	Bluefruit Feather52
Serial Number	8B9CE51B850F75A7
Firmware Revision	0.5.0,S132,2.0.1
Software Revision	0.4.5
Manufacturer Name	Adafruit Industries

BLEUart

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEUart is a wrapper class for NUS (Nordic UART Service), which is a proprietary service defined by Nordic Semiconductors that we use as a baseline transport mechanism between Bluefruit modules and our mobile and desktop Bluefruit LE Connect applications. You can use it to easily send ASCII or binary data in both directions, between the peripheral and the central device.

API

BLEUart has the following public API:

```
// RX Callback signature (fires when data was written by the central)
typedef void (*rx_callback_t) (void);

// Constructor
BLEUart(uint16_t fifo_depth = BLE_UART_DEFAULT_FIFO_DEPTH);

virtual err_t begin(void);

bool notifyEnabled(void);

void setRxCallback( rx_callback_t fp);

// Stream API
virtual int      read      ( void );
virtual int      read      ( uint8_t * buf, size_t size );
virtual size_t   write     ( uint8_t b );
virtual size_t   write     ( const uint8_t *content, size_t len );
virtual int      available ( void );
virtual int      peek      ( void );
virtual void     flush     ( void );

// Pull in write(str) and write(buf, size) from Print
using Print::write;
```

Example

The following example shows how to use the BLEUart helper class.

This example may be out of date, and you should always consult the latest example code in the nRF52 BSP!

```
#include <bluefruit.h>

BLEDis bledis;
BLEUart bleuart;
BLEBas blebas;

#define STATUS_LED (17)
#define BLINKY_MS (2000)
```

```

uint32_t blinkyms;

void setup()
{
  Serial.begin(115200);

  Serial.println("Bluefruit52 BLEUART Example");

  // Setup LED pins and reset blinky counter
  pinMode(STATUS_LED, OUTPUT);
  blinkyms = millis();

  // Setup the BLE LED to be enabled on CONNECT
  // Note: This is actually the default behaviour, but provided
  // here in case you want to control this manually via PIN 19
  Bluefruit.autoConnLed(true);

  Bluefruit.begin();
  Bluefruit.setName("Bluefruit52");
  Bluefruit.setConnectCallback(connect_callback);
  Bluefruit.setDisconnectCallback(disconnect_callback);

  // Configure and Start Device Information Service
  bledis.setManufacturer("Adafruit Industries");
  bledis.setModel("Bluefruit Feather52");
  bledis.begin();

  // Configure and Start BLE Uart Service
  bleuart.begin();

  // Start BLE Battery Service
  blebas.begin();
  blebas.update(100);

  // Set up Advertising Packet
  setupAdv();

  // Start Advertising
  Bluefruit.Advertising.start();
}

void setupAdv(void)
{
  Bluefruit.Advertising.addFlags(BLE_GAP_ADV_FLAGS_LE_ONLY_GENERAL_DISC_MODE);
  Bluefruit.Advertising.addTxPower();

  // Include bleuart 128-bit uuid
  Bluefruit.Advertising.addService(bleuart);

  // There is no room for Name in Advertising packet
  // Use Scan response for Name
  Bluefruit.ScanResponse.addName();
}

void loop()
{
  // Blinky!
  if (blinkyms+BLINKY_MS < millis()) {
    blinkyms = millis();
    digitalWrite(STATUS_LED,

```

```

    digitalWrite(STATUS_LED);
}

// Forward from Serial to BLEUART
if (Serial.available())
{
    // Delay to get enough input data since we have a
    // limited amount of space in the transmit buffer
    delay(2);

    uint8_t buf[64];
    int count = Serial.readBytes(buf, sizeof(buf));
    bleuart.write( buf, count );
}

// Forward from BLEUART to Serial
if ( bleuart.available() )
{
    uint8_t ch;
    ch = (uint8_t) bleuart.read();
    Serial.write(ch);
}
}

void connect_callback(void)
{
    Serial.println("Connected");
}

void disconnect_callback(uint8_t reason)
{
    (void) reason;

    Serial.println();
    Serial.println("Disconnected");
    Serial.println("Bluefruit will start advertising again");
}

```

BLEClientUart

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEClientUart is a wrapper class for the client side of the NUS or 'Nordic UART Service' (aka 'BLE UART'). It is only required when your Bluefruit nRF52 board is acting as Central communicating to other BLE peripherals that expose the [BLEUart](#) service.

API

BLEClientUart has the following public API:

```
// Callback Signatures
typedef void (*rx_callback_t) (BLEClientUart& svc);

BLEClientUart(uint16_t fifo_depth = BLE_UART_DEFAULT_FIFO_DEPTH);

virtual bool begin(void);
virtual bool discover(uint16_t conn_handle);

void setRxCallback( rx_callback_t fp);

bool enableTXD(void);
bool disableTXD(void);

// Stream API
virtual int read ( void );
virtual int read ( uint8_t * buf, size_t size );
virtual int read ( char * buf, size_t size ) { return read( (uint8_t*) buf, size); }
virtual size_t write ( uint8_t b );
virtual size_t write ( const uint8_t *content, size_t len );
virtual int available ( void );
virtual int peek ( void );
virtual void flush ( void );
```

Examples

The following example shows how to use the BLEClientUart helper class.

```
#include <bluefruit.h>

BLEClientDis clientDis;
BLEClientUart clientUart;

void setup()
{
  Serial.begin(115200);

  Serial.println("Bluefruit52 Central BLEUART Example");
  Serial.println("-----\n");

  // Initialize Bluefruit with maximum connections as Peripheral = 0, Central = 1
```

```

// SRAM usage required by SoftDevice will increase dramatically with number of connections
Bluefruit.begin(0, 1);

Bluefruit.setName("Bluefruit52 Central");

// Configure DIS client
clientDis.begin();

// Init BLE Central Uart Service
clientUart.begin();
clientUart.setRxCallback(bleuart_rx_callback);

// Increase Blink rate to different from PrPh advertising mode
Bluefruit.setConnLedInterval(250);

// Callbacks for Central
Bluefruit.Central.setConnectCallback(connect_callback);
Bluefruit.Central.setDisconnectCallback(disconnect_callback);

/* Start Central Scanning
 * - Enable auto scan if disconnected
 * - Interval = 100 ms, window = 80 ms
 * - Don't use active scan
 * - Start(timeout) with timeout = 0 will scan forever (until connected)
 */
Bluefruit.Scanner.setRxCallback(scan_callback);
Bluefruit.Scanner.restartOnDisconnect(true);
Bluefruit.Scanner.setInterval(160, 80); // in unit of 0.625 ms
Bluefruit.Scanner.useActiveScan(false);
Bluefruit.Scanner.start(0); // // 0 = Don't stop scanning after n seconds
}

/**
 * Callback invoked when scanner pick up an advertising data
 * @param report Structural advertising data
 */
void scan_callback(ble_gap_evt_adv_report_t* report)
{
    // Check if advertising contain BleUart service
    if ( Bluefruit.Scanner.checkReportForService(report, clientUart) )
    {
        Serial.print("BLE UART service detected. Connecting ... ");

        // Connect to device with bleuart service in advertising
        Bluefruit.Central.connect(report);
    }
}

/**
 * Callback invoked when an connection is established
 * @param conn_handle
 */
void connect_callback(uint16_t conn_handle)
{
    Serial.println("Connected");

    Serial.print("Discovering DIS ... ");
    if ( clientDis.discover(conn_handle) )
    {
        Serial.println("Found it");
    }
}

```

```

char buffer[32+1];

// read and print out Manufacturer
memset(buffer, 0, sizeof(buffer));
if ( clientDis.getManufacturer(buffer, sizeof(buffer)) )
{
    Serial.print("Manufacturer: ");
    Serial.println(buffer);
}

// read and print out Model Number
memset(buffer, 0, sizeof(buffer));
if ( clientDis.getModel(buffer, sizeof(buffer)) )
{
    Serial.print("Model: ");
    Serial.println(buffer);
}

Serial.println();
}

Serial.print("Discovering BLE Uart Service ... ");

if ( clientUart.discover(conn_handle) )
{
    Serial.println("Found it");

    Serial.println("Enable TXD's notify");
    clientUart.enableTXD();

    Serial.println("Ready to receive from peripheral");
}else
{
    Serial.println("Found NONE");

    // disconnect since we couldn't find bleuart service
    Bluefruit.Central.disconnect(conn_handle);
}
}

/**
 * Callback invoked when a connection is dropped
 * @param conn_handle
 * @param reason
 */
void disconnect_callback(uint16_t conn_handle, uint8_t reason)
{
    (void) conn_handle;
    (void) reason;

    Serial.println("Disconnected");
}

/**
 * Callback invoked when uart received data
 * @param uart_svc Reference object to the service where the data
 * arrived. In this example it is clientUart
 */
void bleuart_rx_callback(BLEClientUart& uart_svc)

```

```

{
  Serial.print("[RX]: ");

  while ( uart_svc.available() )
  {
    Serial.print( (char) uart_svc.read() );
  }

  Serial.println();
}

void loop()
{
  if ( Bluefruit.Central.connected() )
  {
    // Not discovered yet
    if ( clientUart.discovered() )
    {
      // Discovered means in working state
      // Get Serial input and send to Peripheral
      if ( Serial.available() )
      {
        delay(2); // delay a bit for all characters to arrive

        char str[20+1] = { 0 };
        Serial.readBytes(str, 20);

        clientUart.print( str );
      }
    }
  }
}

```

BLEBeacon

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

The BLEBeacon helper class allows you to easily configure the nRF52 as a 'Beacon', which uses the advertising packet to send out a specifically format chunk of data to any devices in listening range.

The following values must be set in order to generate a valid 'Beacon' packet:

- **Manufacturer ID:** A 16-bit value ([registered with the Bluetooth SIG](#)!) that identifies the manufacturer.
- **Major:** A 16-bit 'Major' number, used to differentiate beacon nodes.
- **Minor:** A 16-bit 'Minor' number, used to differentiate beacon nodes.
- **RSSI @ 1M:** A signed 8-bit value (int8_t) indicating the RSSI measurement at 1m distance from the node, used to estimate distance to the beacon itself.

These values can either be set in the constructor, or via the individual functions exposed as part of this helper class.

API

BLEBeacon has the following public API:

```
// Constructors
BLEBeacon(void);
BLEBeacon(uint8_t const uuid128[16]);
BLEBeacon(uint8_t const uuid128[16], uint16_t major, uint16_t minor, int8_t rssi);

// Set the beacon payload values
void setManufacturer(uint16_t manufacturer);
void setUuid(uint8_t const uuid128[16]);
void setMajorMinor(uint16_t major, uint16_t minor);
void setRssiAt1m(int8_t rssi);

// Start advertising
bool start(void);
bool start(BLEAdvertising& adv);
```

In addition to these functions, the BLEAdvertising class (accessible via `Bluefruit.Advertising.*`) exposes the following function to assign Beacon payload to the advertising payload:

```
bool setBeacon(BLEBeacon& beacon);
```

See the example below for a concrete usage example.

Example

The following example will configure the nRF52 to advertise a 'Beacon' payload:

```

#include <bluefruit.h>

// Beacon uses the Manufacturer Specific Data field in the advertising
// packet, which means you must provide a valid Manufacturer ID. Update
// the field below to an appropriate value. For a list of valid IDs see:
// https://www.bluetooth.com/specifications/assigned-numbers/company-identifiers
// 0x004C is Apple (for example)
#define MANUFACTURER_ID 0x004C

// AirLocate UUID: E2C56DB5-DFFB-48D2-B060-D0F5A71096E0
uint8_t beaconUuid[16] =
{
    0xE2, 0xC5, 0x6D, 0xB5, 0xDF, 0xFB, 0x48, 0xD2,
    0xB0, 0x60, 0xD0, 0xF5, 0xA7, 0x10, 0x96, 0xE0,
};

// A valid Beacon packet consists of the following information:
// UUID, Major, Minor, RSSI @ 1M
BLEBeacon beacon(beaconUuid, 0x0001, 0x0000, -54);

void setup()
{
    Serial.begin(115200);

    Serial.println("Bluefruit52 Beacon Example");

    Bluefruit.begin();
    Bluefruit.setName("Bluefruit52");

    // Manufacturer ID is required for Manufacturer Specific Data
    beacon.setManufacturer(MANUFACTURER_ID);

    // Setup the advertising packet
    setupAdv();

    // Start advertising
    Bluefruit.Advertising.start();
}

void setupAdv(void)
{
    // Set the beacon payload using the BLEBeacon class populated
    // earlier in this example
    Bluefruit.Advertising.setBeacon(beacon);

    // char* adv = Bluefruit.Advertising.getData();

    // There is no room left for 'Name' in the advertising packet
    // Use the optional secondary Scan Response packet for 'Name' instead
    Bluefruit.ScanResponse.addName();
}

void loop()
{
    // Toggle both LEDs every second
    digitalToggle(LED_BUILTIN);
    delay(1000);
}

```

Testing

If you test with the nRF Beacons application ([iOS](#) or [Android](#)) you can configure the app to look for the UUID, Manufacturer ID, Major and Minor values you provided, and you should be able to see the beacon, as shown in the two screenshots below:

Make sure that the UUID, Major and Minor values match or the application won't detect your beacon node!

BLEMidi

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEMidi is a helper class that adds support for sending and receiving MIDI Messages using the [MIDI over Bluetooth LE specification](#). BLEMidi supports the full standard MIDI protocol (including SysEx messages), and it also can act as the hardware interface for the [Arduino MIDI Library](#).

API

BLEMidi has the following public API.

```
// Constructor
BLEMidi(uint16_t fifo_depth = 128);

err_t      begin      (void);
bool       notifyEnabled (void);

// Stream API for Arduino MIDI Library Interface
int         read       (void);
size_t      write      (uint8_t b);
int         available  (void);
int         peek       (void);
void        flush      (void);

size_t      write      (const char *str);
size_t      write      (const uint8_t *buffer, size_t size);
```

Installing the Arduino MIDI Library

BLEMidi is easiest to use when combined with the [Arduino MIDI Library](#). You will need **version 4.3.0 or higher** installed before continuing with the example code.

Next, select **Communication** from the topic dropdown, and enter **MIDI Library** into the search box. Click the **Install** button to install version 4.3.0 or higher of the **MIDI Library**.

Example

The **blemidi** example demonstrates how to use the BLEMidi helper class with the **Arduino MIDI Library**. The example sends a looping arpeggio, and prints any incoming MIDI note on and note off messages to the Arduino Serial Monitor.

This example may be out of date, and you should always consult the latest example code in the Bluefruit52 example folder!

    }
}

```

```
// Don't continue if the connected device isn't ready to receive messages.  
if (! blemidi.notifyEnabled()) {  
    return;  
}  
  
// read any new MIDI messages  
MIDI.read();  
}
```

Usage

You will need to do a small bit of setup on your selected platform to connect to the BLE MIDI enabled Bluefruit52.

Click on a platform below to view BLE MIDI setup instructions for your device:

- [macOS \(OS X\)](#)
- [iOS](#)
- [Android](#)
- [Windows](#)

The arpeggio should automatically play once the Bluefruit52 is connected to your software synth. The video below shows the Bluefruit52 connected to [Moog's Animoog on iOS](#).

Note: The board used in the video was a pre-release prototype. The production boards are standard Adafruit Black.

BLEHidAdafruit

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEHidAdafruit allows you to simulate a mouse or keyboard using the HID (Human Interface Device) profile that is part of the Bluetooth Low Energy standard.

Most modern mobile devices with Bluetooth Low Energy support, and the latest operating systems generally support Bluetooth Low Energy mice and keyboards out of the box, once you pair your Bluefruit nRF52 Feather and run an appropriate sketch.

API

The BLEHidAdafruit helper class has the following public API:

```
// Constructor
BLEHidAdafruit(void);

// Call this once to start the HID service
virtual err_t begin(void);

// Keyboard
err_t keyboardReport(hid_keyboard_report_t* report);
err_t keyboardReport(uint8_t modifier, uint8_t keycode[6]);
err_t keyboardReport(uint8_t modifier, uint8_t keycode0, uint8_t keycode1=0, uint8_t keycode2=0, uint8_t

err_t keyPress(char ch);
err_t keyRelease(void);
err_t keySequence(const char* str, int interval=5);

// Consumer Media Keys
err_t consumerReport(uint16_t usage_code);
err_t consumerKeyPress(uint16_t usage_code);
err_t consumerKeyRelease(void);

// Mouse
err_t mouseReport(hid_mouse_report_t* report);
err_t mouseReport(uint8_t buttons, int8_t x, int8_t y, int8_t wheel=0, int8_t pan=0);

err_t mouseButtonPress(uint8_t buttons);
err_t mouseButtonRelease(void);

err_t mouseMove(int8_t x, int8_t y);
err_t mouseScroll(int8_t scroll);
err_t mousePan(int8_t pan);
```

Example Sketches

There are a variety of example sketches showing how to use the BLEHidAdafruit class. You can browse the latest source code on Github with the following links:

- [hid_keyboard](#): This example will simulate an HID keyboard, waiting for data to arrive via the nRF52's serial port (via USB serial), and send that data over the air to the bonded Central device.
- [hid_mouse](#): This example will simulate an HID mouse. To use it run the sketch and open the Serial Monitor, then enter the appropriate characters to move the mouse or trigger/release the mouse buttons.

Bonding HID Devices

In order to use your HID mouse or keyboard, you will first need to **bond** the two devices. The bonding process involves the following steps:

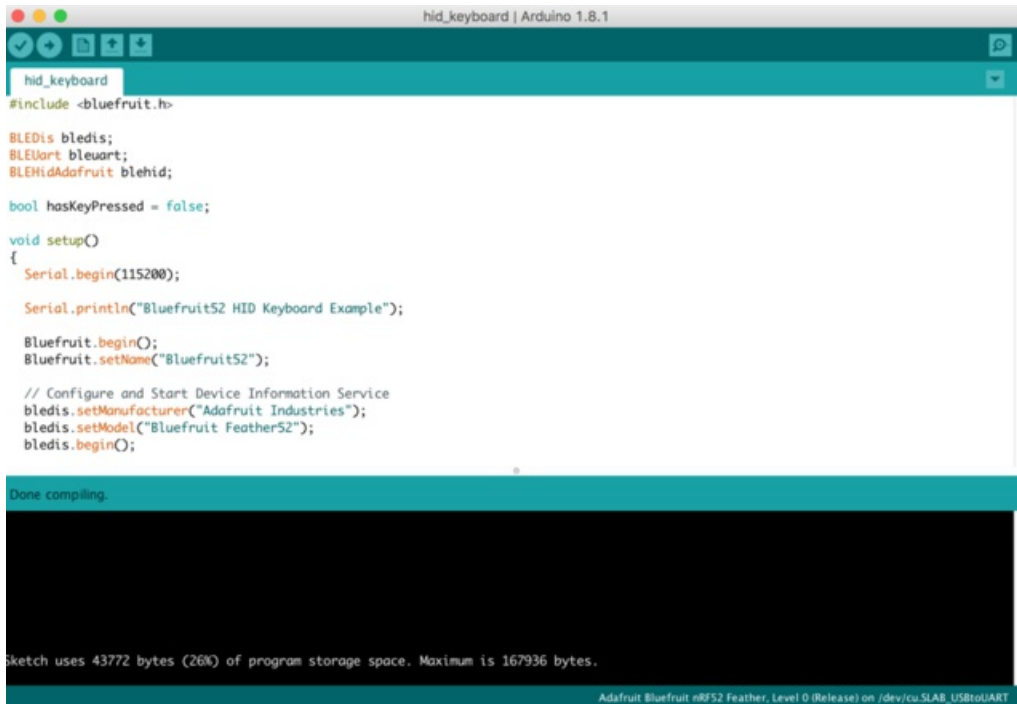

- The two devices will connect to each other normally
- A set of security keys are exchanged between the two devices, and stores in non-volatile memory on each side. This is to ensure that each side is reasonably confident it is talking to the device it thinks it is for future connections, and to encrypt over the air communication between the devices (so that people can 'sniff' your keyboard data, etc.).
- On the nRF52 side this key data will be stored in a section of flash memory reserved for this purpose using an internal file system.
- The process of storing these security keys is referred to as **bonding**, and allows bonded devices to securely communicate without user interaction in the future.
- To cancel the bonding agreement, you can simply delete the keys on the nRF52 via the [clearbonds](#) sketch, or delete the bonding data on your mobile device or computer.

If you run into any bonding problems, try running the [clearbonds](#) sketch to remove and old bonding data from local non-volatile memory!

Setting up your Bluefruit device for bonding

To bond an device, run an appropriate HID sketch on the nRF52 to emulate either an HID mouse or an HID keyboard. In the event that you use the HID mouse example you may need to open the Serial Monitor to use it.

In this example we'll run the **hid_keyboard** example sketch, flashing it to the nRF52, which should give you the following results:

```
hid_keyboard
#include <bluefruit.h>

BLEDS bledis;
BLEUART bleuart;
BLEHIDAdafruit blehid;

bool hasKeyPressed = false;

void setup()
{
  Serial.begin(115200);

  Serial.println("Bluefruit52 HID Keyboard Example");

  Bluefruit.begin();
  Bluefruit.setName("Bluefruit52");

  // Configure and Start Device Information Service
  bledis.setManufacturer("Adafruit Industries");
  bledis.setModel("Bluefruit Feather52");
  bledis.begin();
}
```

Done compiling.

Sketch uses 43772 bytes (26%) of program storage space. Maximum is 167936 bytes.

Adafruit Bluefruit nRF52 Feather, Level 0 (Release) on /dev/cu.SLAB_USBtoUART

Opening the Serial Monitor will give you the following output (though it may differ depending on the debug level you have selected):

Bonding on iOS

To bond to an iOS device, make sure the sketch is running (as described above) and go into your **Settings** app and Select **Bluetooth**.

You should see a device at the bottom of this page called **Bluefruit52** (this may vary depending on the version of the sketch you are using!):

Click the device, and you will get a pairing request like this:

Click the **Pair** button, and the devices will be paired and bonded, and will automatically connect to each other in the future.

If everything went well, you will see the device in your **MY DEVICES** list, as follows:

Testing the HID Keyboard and Bonding

To test the HID keyboard sketch and bonding process, open the **Serial Monitor** (or your favorite terminal emulator), enter some text, and if you are using the Serial Monitor click the **Send** button. This will send some text over the air to whatever textbox or text control has focus in your app.

The text will then appear in your mobile app or bonded device.

If the characters don't match exactly what you send, be sure to check your **keyboard language** settings, since you may be sending data to a device with a different keyboard setup!

BLEAncs

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEAncs is a helper class that enables you to receive notifications from the [Apple Notification Center Service](#) from devices such as an iPhone or iPad. It can be used to receive alerts such as incoming or missed calls, email messages, or most alerts that appear on the mobile device's screen when locked.

API

Because the BLEAncs class is a work in progress, the latest public API for the BLEAncs helper class should be viewed [here](#).

ANCS OLED Example

The [ancs_oled](#) example uses the [Adafruit FeatherWing OLED](#) to display any incoming alerts.

Sketch Requirements

In order to use this example sketch the following libraries must be installed on your system:

- [Adafruit_GFX](#) ([Github source](#))
- [Adafruit_SSD1306](#) ([Github source](#))
- Version 0.6.0 or higher of the Bluefruit nRF52 BSP

Loading the Sketch

The ancs_oled sketch can be loaded via the examples menu under **Peripheral** > **ancs_oled**:

With the sketch loaded, you can build the firmware and then flash it to your device via the **Upload** button or menu option:

Make sure that the Adafruit_SSD1306.h file has the 'SSD1306_128_32' macro enabled. Running the sketch with 'SSD1306_128_64' set will cause corrupted data to appear on the OLED display.

Once the sketch is running on the nRF52 Feather you can proceed with the one-time pairing process, described below.

Pairing to your Mobile Device

Before you can start receiving notifications, you will need to 'pair' the nRF52 Feather and the mobile device.

The pairing process causes a set of keys to be exchanged and stored on the two devices so that each side knows it is talking to the same device it originally bonded with, and preventing any devices in the middle from eavesdropping on potentially sensitive data.

The one-time pairing process is described below, and assumes you are already running the ancs_oled sketch on your nRF52 device.

1. In the **Settings** app go to **Bluetooth**:

2. Scroll to the bottom of the list of 'My Devices' and click on **Bluefruit52** under **Other Devices**:

3. When the pairing dialog box comes up, click the **Pair** button:

4. Wait for the pairing process to complete, at which point **Bluefruit52** should appear in the **My Devices** list with the **Connected** status:

Bluefruit52

Connected ⓘ

Once two devices have been paired, they will automatically reconnect to each other whenever they are in range and have their Bluetooth radios enabled.

Wait for Alerts

At this point, any alerts that the mobile device generates will be displayed on the OLED display along with the notification category and date:

Certain alerts (such as incoming calls) can also have actions associated with them, making use of the three buttons on the left-hand side of the display to decide which action to take.

In the `ancs_oled` example, we have a special section of code for incoming calls where you can accept or decline a call with an appropriate button press:

```

// Check buttons
uint32_t presedButtons = readPressedButtons();

if ( myNotifs[activeIndex].ntf.categoryID == ANCS_CAT_INCOMING_CALL )
{
    /* Incoming call event
     * - Button A to accept call
     * - Button C to decline call
     */
    if ( presedButtons & bit(BUTTON_A) )
    {
        bleancs.actPositive(myNotifs[activeIndex].ntf.uid);
    }

    if ( presedButtons & bit(BUTTON_C) )
    {
        bleancs.actNegative(myNotifs[activeIndex].ntf.uid);
    }
}

```

BLEClientCts

The Bluefruit nRF52 Feather codebase is in an early BETA stage and is undergoing active development based on customer feedback and testing. As such, the class documentation here is incomplete, and you should consult the Github repo for the latest code and API developments: <https://goo.gl/LdEx62>

BLEClientCts is a helper class that implements adopted [Current Time Service](#) , which enables you to receive time from devices such as an iPhone or iPad.

API

```
// Callback Signatures
typedef void (*adjust_callback_t) (uint8_t reason);

BLEClientCts(void);

virtual bool begin(void);
virtual bool discover(uint16_t conn_handle);

bool getCurrentTime(void);
bool getLocalTimeInfo(void);

bool enableAdjust(void);
void setAdjustCallback(adjust_callback_t fp);

// https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.current_time
struct ATTR_PACKED {
    uint16_t year;
    uint8_t month;
    uint8_t day;
    uint8_t hour;
    uint8_t minute;
    uint8_t second;
    uint8_t weekday;
    uint8_t subsecond;
    uint8_t adjust_reason;
} Time;

// https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.local_time_info
struct ATTR_PACKED {
    int8_t timezone;
    uint8_t dst_offset;
} LocalInfo;
```

Client CTS OLED Example

The [client_cts_oled](#) example uses the [Adafruit FeatherWing OLED](#) to display received time.

Sketch Requirements

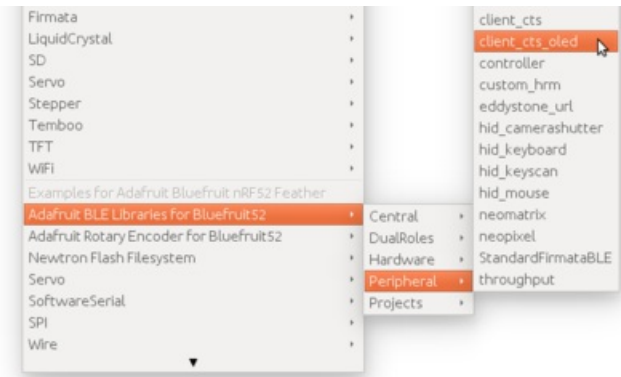

In order to use this example sketch the following libraries must be installed on your system:

- [Adafruit_GFX](#) ([Github source](#))

- [Adafruit_SSD1306](#) ([Github source](#))

Loading the Sketch

The `client_cts_oled` sketch can be loaded via the examples menu under **Peripheral > client_cts_oled**:

With the sketch loaded, you can build the firmware and then flash it to your device via the **Upload** button or menu option. Once the sketch is running on the nRF52 Feather you can proceed with the one-time pairing process, described below.

Make sure that the `Adafruit_SSD1306.h` file has the `'SSD1306_128_32'` macro enabled. Running the sketch with `'SSD1306_128_64'` set will cause corrupted data to appear on the OLED display.

Pairing to your Mobile Device

Before you can start receiving notifications, you will need to 'pair' the nRF52 Feather and the mobile device.

The pairing process causes a set of keys to be exchanged and stored on the two devices so that each side knows it is talking to the same device it originally bonded with, and preventing any devices in the middle from eavesdropping on potentially sensitive data.

The one-time pairing process is described below, and assumes you are already running the `ancs_oled` sketch on your nRF52 device.

1. In the **Settings** app go to **Bluetooth**:

2. Scroll to the bottom of the list of 'My Devices' and click on **Bluefruit52** under **Other Devices**:

OTHER DEVICES 

Bluefruit52

3. When the pairing dialog box comes up, click the **Pair** button:

Bluetooth Pairing Request

"Bluefruit52" would like to pair with
your iPhone.

Cancel

Pair

4. Wait for the pairing process to complete, at which point **Bluefruit52** should appear in the **My Devices** list with the **Connected** status:

Bluefruit52

Connected

Once two devices have been paired, they will automatically reconnect to each other whenever they are in range and have their Bluetooth radios enabled.

Wait for Time Data

At this point, time data from the mobile device will be read and display on the the OLED. For demo purpose the sketch will read time data from mobile once every second. However, in reality, nRF52 should have an internal timer that keep track of second, and only read/sync with mobile after several hours or days, similar to how IP device got time from NTP

server.

BLECentral

This page is a work in progress as the API is changing as we migrate to S132v5 and add better Central mode support.

The Central mode API is accessible via `Bluefruit.Central.*` and has the following public functions:

```
void begin(void);

/*-----*/
/* GAP
 *-----*/
bool    setConnInterval(uint16_t min, uint16_t max);
bool    setConnIntervalMS (uint16_t min_ms, uint16_t max_ms);

bool    connect(const ble_gap_evt_adv_report_t* adv_report);
bool    connect(const ble_gap_addr_t *peer_addr);
bool    disconnect(uint16_t conn_handle);

bool    connected (uint16_t conn_handle); // If connected to a specific peripheral
bool    connected (void);                // If connected to any peripherals

/*----- Callbacks -----*/
void setConnectCallback  ( BLEGap::connect_callback_t  fp);
void setDisconnectCallback( BLEGap::disconnect_callback_t fp);
```

For examples of how to use the Central mode API, see the [Central examples folder](#).

nRF52 ADC

The nRF52832 includes an adjustable 'successive-approximation ADC' which can be configured to convert data with up to 14-bit resolution (0..16383), and the reference voltage can be adjusted up to 3.6V internally.

The default values for the ADC are **10-bit resolution (0..1023)** with a **3.6V reference voltage**, meaning every digit returned from the ADC = $3600\text{mV}/1024 = 3.515625\text{mV}$.

Analog Reference Voltage

The internal reference voltage is 0.6V with a variable gain setting, and can be adjust via the `analogReference(...)` function, providing one of the following values:

- `AR_INTERNAL` (0.6V Ref * 6 = 0..3.6V) <-- DEFAULT
- `AR_INTERNAL_3_0` (0.6V Ref * 5 = 0..3.0V)
- `AR_INTERNAL_2_4` (0.6V Ref * 4 = 0..2.4V)
- `AR_INTERNAL_1_8` (0.6V Ref * 3 = 0..1.8V)
- `AR_INTERNAL_1_2` (0.6V Ref * 2 = 0..1.6V)
- `AR_VDD4` (VDD/4 REF * 4 = 0..VDD)

For example:

```
// Set the analog reference to 3.0V (default = 3.6V)
analogReference(AR_INTERNAL_3_0);
```

Analog Resolution

The ADC resolution can be set to 8, 10, 12 or 14 bits using the `analogReadResolution(...)` function, with the default value being 10-bit:

```
// Set the resolution to 12-bit (0..4095)
analogReadResolution(12); // Can be 8, 10, 12 or 14
```

Default ADC Example (10-bit, 3.6V Reference)

The original source for this code is included in the nRF52 BSP and can be viewed online [here](#).

```

int adcin    = A5;
int adcvalue = 0;
float mv_per_lsb = 3600.0F/1024.0F; // 10-bit ADC with 3.6V input range

void setup() {
  Serial.begin(115200);
}

void loop() {
  // Get a fresh ADC value
  adcvalue = analogRead(adcin);

  // Display the results
  Serial.print(adcvalue);
  Serial.print(" ");
  Serial.print((float)adcvalue * mv_per_lsb);
  Serial.println(" mV");

  delay(100);
}

```

Advanced Example (12-bit, 3.0V Reference)

The original source for this code is included in the nRF52 BSP and can be viewed online [here](#).

```

#define VBAT_PIN          (A7)
#define VBAT_MV_PER_LSB   (0.73242188F) // 3.0V ADC range and 12-bit ADC resolution = 3000mV/4096
#define VBAT_DIVIDER       (0.71275837F) // 2M + 0.806M voltage divider on VBAT = (2M / (0.806M + 2M))
#define VBAT_DIVIDER_COMP (1.403F)      // Compensation factor for the VBAT divider

int readVBAT(void) {
  int raw;

  // Set the analog reference to 3.0V (default = 3.6V)
  analogReference(AR_INTERNAL_3_0);

  // Set the resolution to 12-bit (0..4095)
  analogReadResolution(12); // Can be 8, 10, 12 or 14

  // Let the ADC settle
  delay(1);

  // Get the raw 12-bit, 0..3000mV ADC value
  raw = analogRead(VBAT_PIN);

  // Set the ADC back to the default settings
  analogReference(AR_DEFAULT);
  analogReadResolution(10);

  return raw;
}

uint8_t mvToPercent(float mvolts) {
  uint8_t battery_level;

  if (mvolts >= 3000)
  {
    battery_level = 100;
  }
}

```

```

        battery_level = 100;
    }
    else if (mvolts > 2900)
    {
        battery_level = 100 - ((3000 - mvolts) * 58) / 100;
    }
    else if (mvolts > 2740)
    {
        battery_level = 42 - ((2900 - mvolts) * 24) / 160;
    }
    else if (mvolts > 2440)
    {
        battery_level = 18 - ((2740 - mvolts) * 12) / 300;
    }
    else if (mvolts > 2100)
    {
        battery_level = 6 - ((2440 - mvolts) * 6) / 340;
    }
    else
    {
        battery_level = 0;
    }

    return battery_level;
}

void setup() {
    Serial.begin(115200);

    // Get a single ADC sample and throw it away
    readVBAT();
}

void loop() {
    // Get a raw ADC reading
    int vbat_raw = readVBAT();

    // Convert from raw mv to percentage (based on LIPO chemistry)
    uint8_t vbat_per = mvToPercent(vbat_raw * VBAT_MV_PER_LSB);

    // Convert the raw value to compensated mv, taking the resistor-
    // divider into account (providing the actual LIPO voltage)
    // ADC range is 0..3000mV and resolution is 12-bit (0..4095),
    // VBAT voltage divider is 2M + 0.806M, which needs to be added back
    float vbat_mv = (float)vbat_raw * VBAT_MV_PER_LSB * VBAT_DIVIDER_COMP;

    // Display the results
    Serial.print("ADC = ");
    Serial.print(vbat_raw * VBAT_MV_PER_LSB);
    Serial.print(" mV (");
    Serial.print(vbat_raw);
    Serial.print(")");
    Serial.print(" LIPO = ");
    Serial.print(vbat_mv);
    Serial.print(" mV (");
    Serial.print(vbat_per);
    Serial.println("%)");

    delay(1000);
}

```

Memory Map

This page applies to BSP 0.8.0 and higher, which introduced bootloader v5.1.0 and S132 v5.x.x. For earlier releases (BSP release < 0.8.0) see bootloader v0.5.0 and S132 v2.x.x at the bottom of this page.

Flash Memory

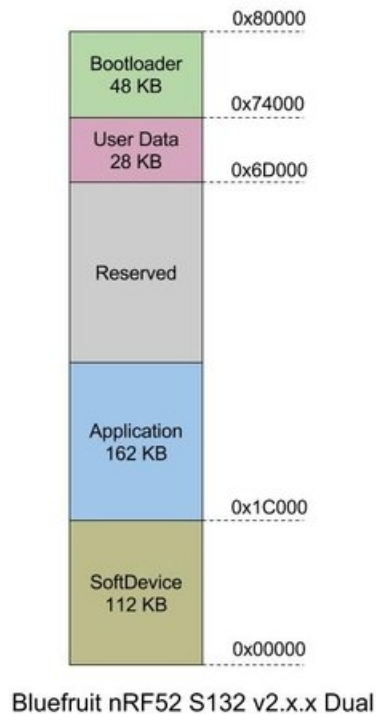

The nRF52832 has 512KB flash memory. The flash layout varies depending on the version of the softdevice (S132v2 or S132v5) and/or bootloader (single/dual bank) used as follows:

Bootloader v5.1.0 with S132 v5.x.x Dual and Single Bank

Bootloader v0.5.0 with S132 v2.x.x Dual banks

Bootloader 0.5.0 with S132 v2.0.1 is obsolete. 0.8.x is last release that will support it. Check the "Using the Bootloader" page for instructions on how to upgrade the bootloader.

- **SoftDevice:** This section of flash memory contains the **Soft Device**, which is Nordic's black box Bluetooth Low Energy stack.
- **Application:** This section of flash memory stores the user sketches that you compile in the Arduino IDE.
- **Reserved:** This section of flash memory is kept empty to enable **dual banks** safe firmware updates. Whenever you try to update the Application are, the new application data will first be written to the free memory section, and the verified before it is swapped out with the current application code. This is to ensure that DFU complete successfully and that the entire image is safely store on the device to avoid losing the application code.
- **User Data:** This 28KB section of flash memory is reserved for config settings. It uses an open source file system called the [Newtron Flash File System](#), which is part of the OpenSource Mynewt operating system. Bonding data is stored here, for example, when you bond the nRF52 with another Central device.
- **DFU Bootloader:** This section of flash memory stores the actual bootloader code that will be executed by the MBR described earlier.

SRAM Layout

The nRF52832 has 64KB of SRAM available, and actual memory use will depend on your project, although the stack and heap memory locations are described below:

- **Soft Device:** amount of SRAM exclusive allocated for SoftDevice by Linker script. The size is subject to change and varies by releases. For BSP release **0.8.0** it is **12.5 KB**. However, the actual memory required by the SoftDevice depends on the run-time configuration determined by Bluefruit's `configNNN()` API.
- **Sketch BSS:** static and global data used by your sketch.
- **Heap Memory:** The largest memory region, this is used for allocating the real time operating systems (RTOS) thread stack, `malloc()` etc. The size, based on the variables shown below, is $Y = 64 - 12.5 - X - 2 \text{ (KB)}$, where 12.5KB will vary depending on the SoftDevice used.
- **Stack Memory:** Used by non RTOS thread code, this is mostly for Interrupt Service Routines (ISRs) and SoftDevice API calls. The current size is **2 KB**.

Functions affecting SoftDevice SRAM usage

The Bluefruit nRF52 **configNNN()** functions set the behavior of SoftDevice, thus determining the total SRAM usage. These functions must be called before **begin()**.

- **configUuid128Count()** : Defines the number of UUID128 entries that the SoftDevice supports, e.g. Bleuart, BleMidi, or other services and characteristics. **Default value is 10.**
- **configAttrTableSize()**: The total size of the attribute table, which holds services and characteristics. If your application needs lots of characteristics you may need to increase this. **Default value is 2048 bytes.**
- **configPrphConn()**, **configPrphBandwidth()**: These functions set the parameters that determine the bandwidth for peripheral's connections. **configPrphBandwidth()** is a convenient helper that calls **configPrphConn()** with appropriate parameters.
- **configCentralConn()**, **configCentralBandwidth()**: These functions set the parameters that determine the bandwidth for central mode connections. **configCentralBandwidth()** is a convenient helper that calls **configCentralConn()** with appropriate parameters.
- **begin()**: Bluefruit nRF52's **begin()** function also affects the bandwidth since it takes 2 (optional) parameters. The first one is the number of concurrent connections for peripheral links (to mobile phones, your computer, etc.), the second one is the number of central links (to BLE accessories, or another feather52 running in peripheral mode). The maximum number of concurrent connections for **SoftDevice v5.x** is 20.

Bluefruit nRF52 S132 v5.x.x SRAM Usage

If you run into an error message saying "SoftDevice require more SRAM than provided by linker", try altering your system config -- for ex. lower bandwidth, fewer connection or a smaller attribute table size. Another advanced option is to modify the linker script, but this should be done with care and knowledge of what you are changing.

[CFG] **SoftDevice** config requires more SRAM than provided by the linker.
App Ram Start must be at least **0x20004180** (provided **0x20003200**).
Please update linker file or re-config **SoftDevice**.

Software Resources

To help you get your Bluefruit LE module talking to other Central devices, we've put together a number of open source tools for most of the major platforms supporting Bluetooth Low Energy.

Bluefruit LE Client Apps and Libraries

Adafruit has put together the following mobile or desktop apps and libraries to make it as easy as possible to get your Bluefruit LE module talking to your mobile device or laptop, with full source available where possible:

Bluefruit LE Connect (Android/Java)

Bluetooth Low Energy support was added to Android starting with Android 4.3 (though it was only really stable starting with 4.4), and we've already released [Bluefruit LE Connect to the Play Store](#).

The full [source code](#) for Bluefruit LE Connect for Android is also available on Github to help you get started with your own Android apps. You'll need a recent version of [Android Studio](#) to use this project.

Bluefruit LE Connect (iOS/Swift)

Apple was very early to adopt Bluetooth Low Energy, and we also have an iOS version of the [Bluefruit LE Connect](#) app available in Apple's app store.

The full swift source code for Bluefruit LE Connect for iOS is also available on Github. You'll need XCode and access to Apple's developer program to use this project:

- Version 1.x source code: https://github.com/adafruit/Bluefruit_LE_Connect
- Version 2.x source code: https://github.com/adafruit/Bluefruit_LE_Connect_v2

Version 2.x of the app is a complete rewrite that includes iOS, OS X GUI and OS X command-line tools in a single codebase.

Adafruit Bluefruit LE Connect

[View More by This Developer](#)

By Adafruit Industries

Open iTunes to buy and download apps.

Description

Wirelessly connect your iOS device to Adafruit Bluefruit LE modules for control & communication with your projects.

Features:

[Adafruit Industries Web Site](#) • [Adafruit Bluefruit LE Connect Support](#) •

[...More](#)

What's New in Version 1.7

- Apple Watch support with Color Picker and Control Pad
- Brightness Slider added to Color Picker
- Bugfixes for XML parsing in DFU mode

[View in iTunes](#)

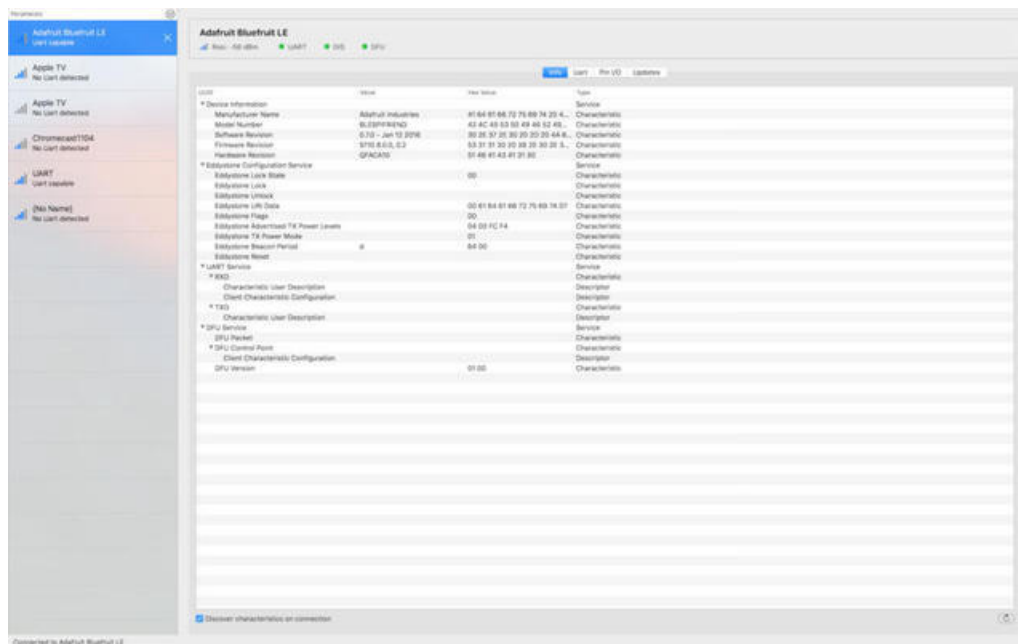

This app is designed for both iPhone and iPad

Bluefruit LE Connect for OS X (Swift)

This OS X desktop application is based on the same V2.x codebase as the iOS app, and gives you access to BLE UART, basic Pin I/O and OTA DFU firmware updates from the convenience of your laptop or mac.

This is a great choice for logging sensor data locally and exporting it as a CSV, JSON or XML file for parsing in another application, and uses the native hardware on your computer so no BLE dongle is required on any recent mac.

The full source is also [available on Github](#).

Bluefruit LE Command Line Updater for OS X (Swift)

This experimental command line tool is unsupported and provided purely as a proof of concept, but can be used to allow firmware updates for Bluefruit devices from the command line.

This utility performs automatic firmware updates similar to the way that the GUI application does, by checking the firmware version on your Bluefruit device (via the Device Information Service), and comparing this against the firmware versions available online, downloading files in the background if appropriate.

Simply install the pre-compiled tool via the [DMG file](#) and place it somewhere in the system path, or run the file locally

via './bluefruit' to see the help menu:

```
$ ./bluefruit
bluefruit v0.3
Usage:
bluefruit <command> [options...]

Commands:
Scan peripherals:    scan
Automatic update:   update [--enable-beta] [--uuid <uuid>]
Custom firmware:    dfu --hex <filename> [--init <filename>] [--uuid <uuid>]
Show this screen:    --help
Show version:        --version

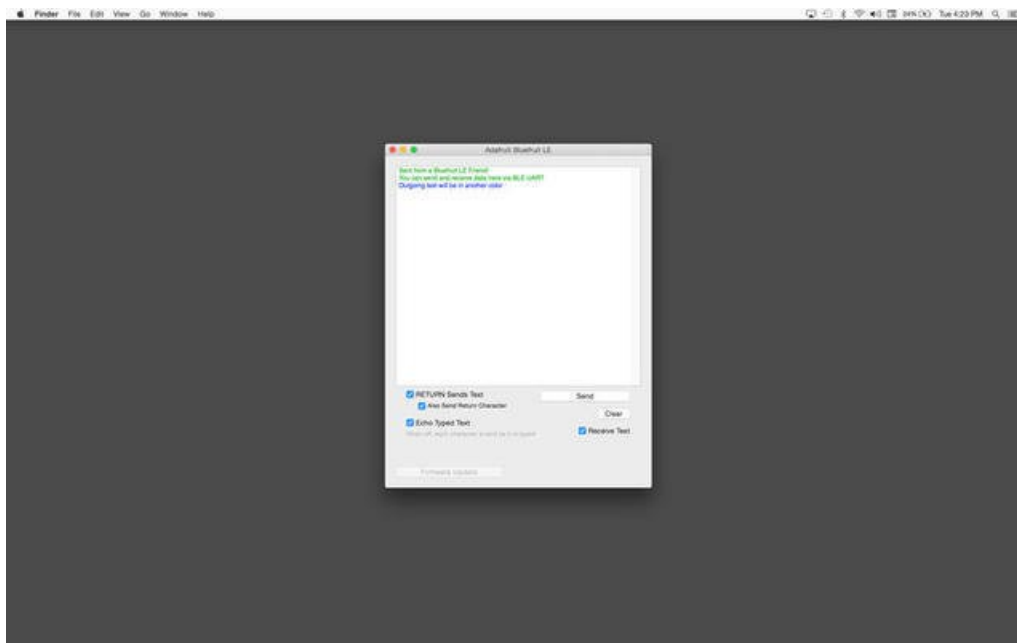

Options:
--uuid <uuid>        If present the peripheral with that uuid is used. If not present a list of peripherals
--enable-beta        If not present only stable versions are used

Short syntax:
-u = --uuid, -b = --enable-beta, -h = --hex, -i = --init, -v = --version, -? = --help
```

Deprecated: Bluefruit Buddy (OS X)

This native OS X application is a basic proof of concept app that allows you to connect to your Bluefruit LE module using most recent macbooks or iMacs. You can get basic information about the modules and use the UART service to send and receive data.

The full source for the application is available in the github repo at [Adafruit_BluefruitLE_OSX](#).

ABLE (Cross Platform/Node+Electron)

ABLE (Adafruit Bluefruit LE Desktop) is a cross-platform desktop application based on Sandeep Misty's [noble](#) library and the [Electron](#) project from Github (used by Atom).

It runs on OS X, Windows 7+ and select flavours of Linux (Ubuntu tested locally). Windows 7 support is particularly interesting since Windows 7 has no native support for Bluetooth Low Energy but the noble library talks directly to [supported Bluetooth 4.0 USB dongles](#) to emulate BLE on the system (though at this stage it's still in early BETA and drops the connection and takes more care to work with).

This app allows you to collect sensor data or perform many of the same functionality offered by the mobile Bluefruit LE Connect apps, but on the desktop.

The app is still in BETA, but full [source](#) is available in addition to the easy to use [pre-compiled binaries](#).

Bluefruit LE Python Wrapper

As a proof of concept, we've played around a bit with getting Python working with the native Bluetooth APIs on OS X and the latest version of Bluez on certain Linux targets.

There are currently example sketches showing how to retrieve BLE UART data as well as some basic details from the Device Information Service (DIS).

This isn't an actively support project and was more of an experiment, but if you have a recent Macbook or a Raspberry Pi and know Python, you might want to look at [Adafruit_Python_BluefruitLE](#) in our github account.

Debug Tools

If your sense of adventure gets the better of you, and your Bluefruit LE module goes off into the weeds, the following tools might be useful to get it back from unknown lands.

These debug tools are provided purely as a convenience for advanced users for device recovery purposes, and are not recommended unless you're OK with potentially bricking your board. Use them at your own risk.

AdaLink (Python)

This command line tool is a python-based wrapper for programming ARM MCUs using either a [Segger J-Link](#) or an [STLink/V2](#). You can use it to reflash your Bluefruit LE module using the latest firmware from the [Bluefruit LE firmware repo](#).

Details on how to use the tool are available in the readme.md file on the main [Adafruit_Adalink](#) repo on Github.

Completely reprogramming a Bluefruit LE module with AdaLink would require four files, and would look something like this (using a JLink):

```
adalink nrf51822 --programmer jlink --wipe
--program-hex "Adafruit_BluefruitLE_Firmware/softdevice/s110_nrf51_8.0.0_softdevice.hex"
--program-hex "Adafruit_BluefruitLE_Firmware/bootloader/bootloader_0002.hex"
--program-hex "Adafruit_BluefruitLE_Firmware/0.6.7/blefriend32/blefriend32_s110_xxac_0_6_7_150917_blefr
--program-hex "Adafruit_BluefruitLE_Firmware/0.6.7/blefriend32/blefriend32_s110_xxac_0_6_7_150917_blefr
```

You can also use the AdaLink tool to get some basic information about your module, such as which SoftDevice is currently programmed or the IC revision (16KB SRAM or 32KB SRAM) via the --info command:

```
$ adalink nrf51822 -p jlink --info
Hardware ID : QFACA10 (32KB)
Segger ID   : nRF51822_xxAC
SD Version  : S110 8.0.0
Device Addr : **:*:*:*:*:*:*
Device ID   : *****
```

Adafruit nRF51822 Flasher (Python)

Adafruit's nRF51822 Flasher is an internal Python tool we use in production to flash boards as they go through the test procedures and off the assembly line, or just testing against different firmware releases when debugging.

It relies on AdaLink or OpenOCD beneath the surface (see above), but you can use this command line tool to flash your nRF51822 with a specific SoftDevice, Bootloader and Bluefruit firmware combination.

It currently supports using either a Segger J-Link or STLink/V2 via AdaLink, or [GPIO on a Raspberry Pi](#) if you don't have access to a traditional ARM SWD debugger. (A pre-built version of OpenOCD for the RPi is included in the repo since building it from scratch takes a long time on the original RPi.)

We don't provide active support for this tool since it's purely an internal project, but made it public just in case it might help an adventurous customer debrick a board on their own.

```
$ python flash.py --jtag=jlink --board=blefriend32 --softdevice=8.0.0 --bootloader=2 --firmware=0.6.7
jtag      : jlink
softdevice : 8.0.0
bootloader : 2
board     : blefriend32
firmware  : 0.6.7
Writing Softdevice + DFU bootloader + Application to flash memory
adalink -v nrf51822 --programmer jlink --wipe --program-hex "Adafruit_BluefruitLE_Firmware/softdevice/s110
...
```

Module Details

The Bluefruit nRF52 Feather uses the MDBT42Q module from Raytac. Details on the module, including FCC and other certifications are available in the document below:

MDBT42Q-Version_B.pdf

<https://adafru.it/vbb>

Schematic

FAQs

NOTE: For FAQs relating to the **BSP**, see the dedicated [BSP FAQ list](#).

What are the differences between the nRF51 and nRF52 Bluefruit boards? Which one should I be using?

The two board families take very different design approaches.

All of the nRF51 based modules are based on an AT command set (over UART or SPI), and require two MCUs to run: the nRF51 hosting the AT command parser, and an external MCU sending AT style commands.

The nRF52 boards run code directly on the nRF52, executing natively and calling the Nordic S132 SoftDevice (their proprietary Bluetooth Low Energy stack) directly. This allows for more efficient code since there is no intermediate AT layer or transport, and also allows for lower overall power consumption since only a single device is involved.

The nRF52 will generally give you better performance, but for situation where you need to use an MCU with a feature the nRF52 doesn't have (such as USB), the nRF51 based boards will still be the preferable solution.

Can I run nRF51 Bluefruit sketches on the nRF52?

No. The two board families are fundamentally different, and have entirely separate APIs and programming models. If you are migrating from the nRF51 to the nRF52, you will need to redesign your sketches to use the newer API, enabling you to build code that runs natively on the nRF52832 MCU.

Can I use the nRF52 as a Central to connect to other BLE peripherals?

The S132 Soft Device and the nRF52832 HW support Central mode, so yes this is *possible*. At this early development stage, though, there is only bare bones support for Central mode in the Adafruit nRF52 codebase, simply to test the HW and S132 and make sure that everything is configured properly. An example is provided of listening for incoming advertising packets, printing the packet contents and meta-data out to the Serial Monitor. We hope to add further Central mode examples in the future, but priority has been given to the Peripheral API and examples for the initial release.

How are Arduino sketches executed on the nRF52832? Can I do hard real time processing (bit-banging NeoPixels, etc.)?

In order to run Arduino code on the nRF52 at the same time as the low level Bluetooth Low Energy stack, the Bluefruit nRF52 Feather uses FreeRTOS as a task scheduler. The scheduler will automatically switch between tasks, assigning clock cycles to the highest priority task at a given moment. This process is generally transparent to you, although it can have implications if you have hard real time requirements. There is no guarantee on the nRF52832 to meet hard timing requirements when the radio is enabled and being actively used for Bluetooth Low Energy. This isn't possible on the nRF52832 even without FreeRTOS, though, since the SoftDevice (Nordic's proprietary binary blob stack) has higher priority than any user code, including control over interrupt handlers.

Can I use GDB to debug my nRF52832?

You can, yes, but it will require a Segger J-Link (that's what we've tested against anyway, other options exist), and it's an advanced operation. But if you're asking about it, you probably know that.

Assuming you have the Segger J-Link drivers installed, you can start Segger's GDB Server from the command line as follows (OSX/Linux used here):

```
$ JLinkGDBServer -device nrf52832_xxaa -if swd -speed auto
```

Then open a new terminal window, making sure that you have access to `gcc-arm-none-eabi-gdb` from the command

line, and enter the following command:

```
$ ./arm-none-eabi-gdb something.ino.elf
```

`something.ino.elf` is the name of the .elf file generated when you built your sketch. You can find this by enabling 'Show verbose output during: [x] compilation' in the Arduino IDE preferences. You CAN run GDB without the .elf file, but pointing to the .elf file will give you all of the meta data like displaying the actual source code at a specific address, etc.

Once you have the `(gdb)` prompt, enter the following command to connect to the Segger GDB server (updating your IP address accordingly, since the HW isn't necessarily local!):

```
(gdb) target remote 127.0.0.1:2331
```

If everything went well, you should see the current line of code where the device is halted (normally execution on the nRF52 will halt as soon as you start the Segger GDB Server).

At this point, you can send GDB debug commands, which is a tutorial in itself! As a crash course, though:

- To continue execution, type '`monitor go`' then '`continue`'
- To stop execution (to read register values, for example.), type '`monitor halt`'
- To display the current stack trace (when halted) enter '`bt`'
- To get information on the current stack frame (normally the currently executing function), try these:
 - `info frame` : Display info on the current stack frame
 - `info args` : Display info on the arguments passed into the stack frame
 - `info locals` : Display local variables in the stack frame
 - `info registers` : Dump the core ARM register values, which can be useful for debugging specific fault conditions

Are there any other cross platform or free debugging options other than GDB?

If you have a [Segger J-Link](#), you can also use [Segger's OZone debugger GUI](#) to interact with the device, though check the license terms since there are usage restrictions depending on the J-Link module you have.

You will need to connect your nRF52 to the J-Link via the SWD and SWCLK pins on the bottom of the PCB, or if you are OK with fine pitch soldering via the SWD header.

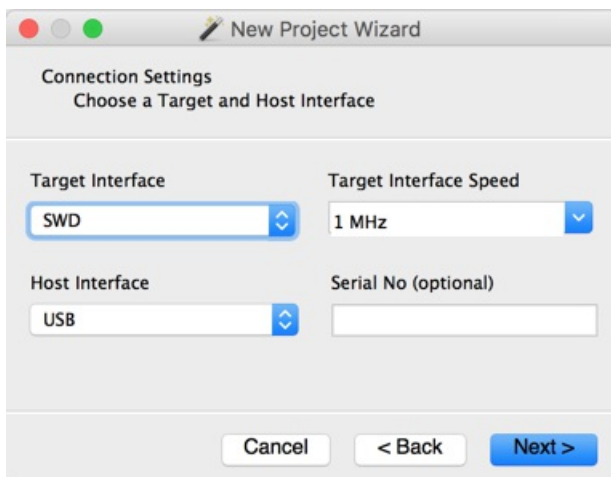

You can either solder on a standard [2x5 SWD header](#) on the pad available in the board, or you can solder wires to the SWD and SWCLK pads on the bottom of the PCB and use an [SWD Cable Breakout Board](#), or just connect cables directly to your J-Link via some other means.

You will also need to connect the **VTRef** pin on the JLink to **3.3V** on the Feather to let the J-Link know what voltage level the target has, and share a common GND by connecting the GND pins on each device.

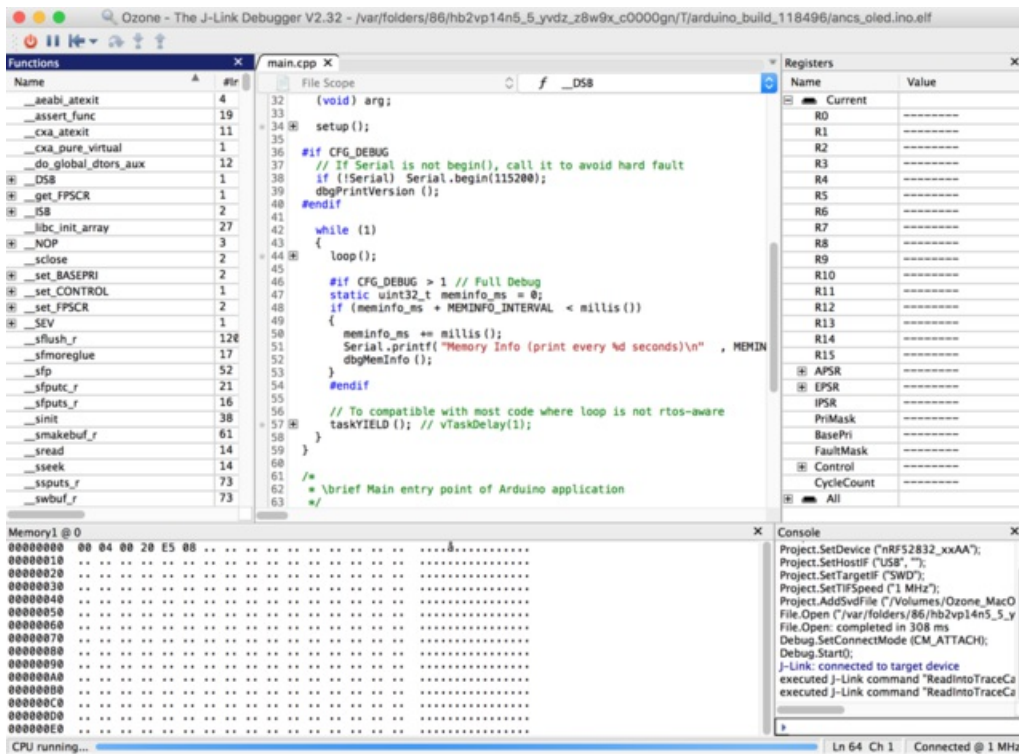

Before you can start to debug, you will need to get the .elf file that contains all the debug info for your sketch. You can find this file by enabling **Show Verbose Output During: compilation** in the **Arduino Preferences** dialogue box. When you build your sketch, you need to look at the log output, and find the .elf file, which will resemble something like this (it will vary depending on the OS

used): `/var/folders/86/hb2vp14n5_5_yvdz_z8w9x_c0000gn/T/arduino_build_118496/ancs_oled.ino.elf`

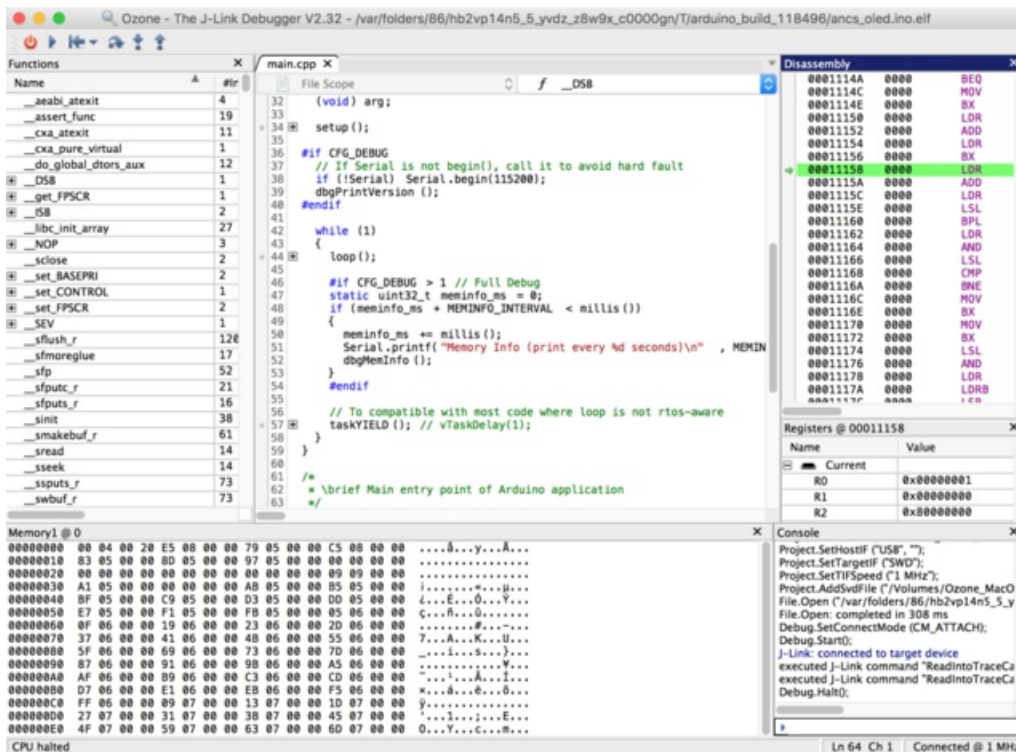

In the OZone New Project Wizard, when prompted to select a target device in OZone select **nRF52832_xxAA**, then make sure that you have set the Target Interface for the debugger to **SWD**, and finally point to the .elf file above:

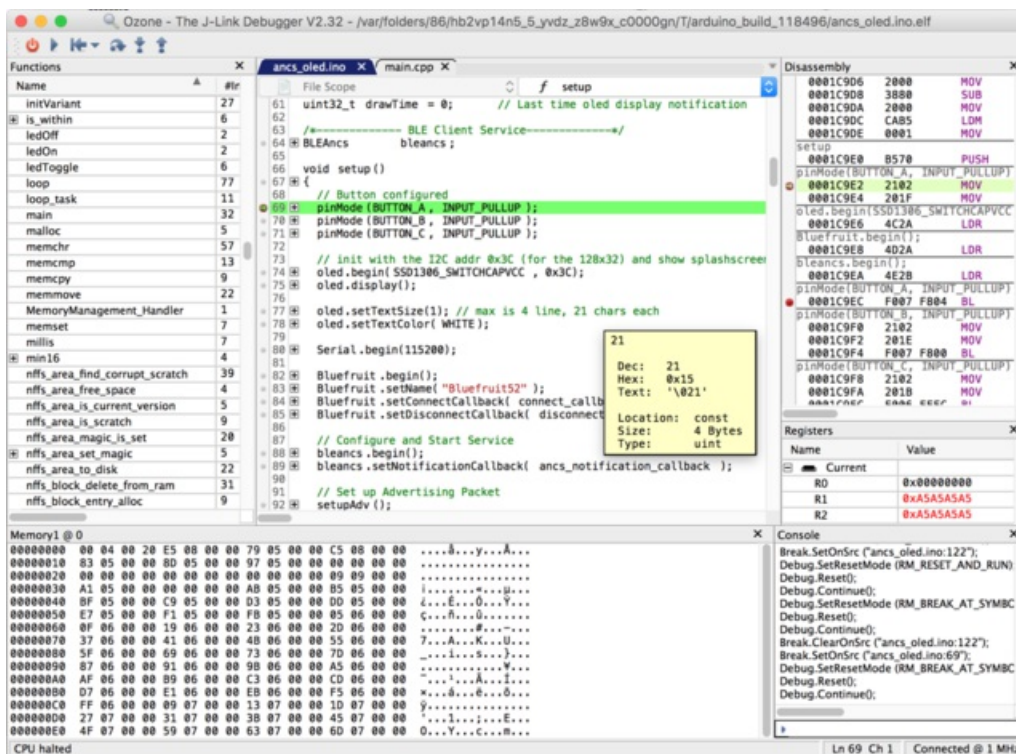

Next select the **Attach to running program** option in the top-left hand corner, or via the menu system, which will cause the debugger to connect to the nRF52 over SWD:

At this point, you can click the **PAUSE** icon to stop program execution, and then analyze variables, or set breakpoints at appropriate locations in your program execution, and debug as you would with most other embedded IDEs!

Clicking on the left-hand side of the text editor will set a breakpoint on line 69 in the image below, for example, and the selecting **Debug > Reset > Reset & Run** from the menu or icon will cause the board to reset, and you should stop at the breakpoint you set:

You can experiment with adding some of the other debug windows and options via the **View** menu item, such as the **Call Stack** which will show you all of the functions that were called before arriving at the current breakpoint:
